PART I--REPORT.

CONTENTS.

	PAGE.
INTRODUCTION	vii-xii
Time and date of Census—Census Towns—Census Units—House Numbering—Enumeration Schedule—Arrangements for Special Areas—Preliminary Enumeration—Final Enumeration—Attitude of the People—Provisional Totals—Slip System—Special Census—Necessity for a Permanent Bureau of Statistics—Publication of Report and Tables—Acknowledgments—Census Expenditure.	
CHAPTER I.—Distribution and movement of Population and Subsidiary Tables	1-17
Foreword—Reference to Tables—Position and Boundaries—Administrative Divisions—Natural Divisions—Meaning of Population Enumerated—Instructions to the Enumerators—Area and Population of the State—Area and Population of Administrative Divisions—Density in General—Density of the State and its Variation since 1875—The Density of Natural Divisions and its Variation since 1911—Sea-Coast Division—Inland Division—Mountainous Division—Variations between 1911 and 1921—Density and its Variation in the Administrative Divisions—Pressure of Population—The steps taken during the Decade for meeting increased demand—Variation in Population at previous Censuses—The increase is normal under the conditions of the State—Conditions which obtained in the State tending towards the increase of Population—The conditions of the Decade under Review—The Movement of Population and Accuracy of Figures returned—Migration—The increase depends chiefly upon Public Health and Economic Conditions—Vital Statistics—Movement of Population in the Natural and Administrative Divisions—The Median Point and Centre of Area—The Position of the Centre of the State the Median Point of Population Houses in the State—Houses in Administrative Divisions and in Towns and Rural areas—House Room and Family and their Variation.	
CHAPTER II.—The Population of Cities, Towns and Villages and Subsidiary Tables	18-26
Preliminary Observations—Reference to Tables—Villages—Variation in Number—Variation in Population—Development of Towns—Towns, (Cantonment and City)—Number of Towns and Arrangements made for Census therein—Statistics for Urban and Rural Areas—Sex and Religion of the Urban Population—Variation of Population in Towns—Density, (Houses and House Room)—Towns in the Natural and Administrative Divisions—Variation in the Major Municipal Towns, Trivandrum, Nagercoil, Alleppey, Quilon, Kottayam.	
CHAPTER III.—Birth Place and Subsidiary Tables	27-33
Opening Remarks—Causes of Migration—Reference to Statistics—Immigrants from outside the State—Emigrants from the State—Types of Migration—Casual Type—The Temporary and Periodical Types—Semi-permanent Type—Permanent Type—Migration into and from Natural Divisions.	
CHAPTER IV.—Religion and Subsidiary Tables	34-43
Reference to Statistics—Scope of the Chapter and Nature of the Return—Distribution of the Population by Religion—Variations in the Decade and Relative Growth of the different Religions—Hinduism (Hindus	

their number and Variation)—Local Distribution—Animism—Muhammadanism (Musalmans their number and variations)—Local Distribution—Christianity—Christians, Number and variation—Europeans—Anglo-Indians—Indian Christian—Syrian Christians—Roman Catholics and Romo-Syrians—Syrian Jacobite—Mar Thoma Syrians—Syrian Chaldeans—Other Indian Christians (Salvation Army)—Yuyomayam Sect—Local Distribution.

CHAPTER V.—Age and Subsidiary Tables ... 44-57

Introduction—Reference to Statistics—The Nature of the Age Return—Age Periods by Religion and Sex—Variation in each quinquennial age period by Sex and Religion in the last 3 Censuses—Age Distribution, General—Life Tables—Men Age—Mean Age for each main Religion—Vital Statistics—Infancy and Childhood—Fecundity—Later Age Period—Centenarians.

CHAPTER VI.—Sex and Subsidiary Tables ... 58-63

Preliminary Remarks—Reference to Statistics—Proportion of Male to Female Births—Ratio of Females and Males in the Population Enumerated in the Census—Variation in Age (Age Period and Age Curves)—Factors contributing towards the lowering of the proportion of Females.

CHAPTER VII.—Civil Condition and Subsidiary Tables ... 68-78

Preliminary Observation—Reference to Statistics—The Nature of the Statistics—Conditions as to Marriage—The Meaning of the term Marriage is different in India from that in other Countries—The Marital Condition in Travancore—The reasons for the isolated condition of Travancore—Infant and Early Marriages—Proportion of Widows—The selection of age periods for the discussion of Marital Conditions—All Religions—Musalmans—Christians—Hindus—The Non-Malayalee Hindus—Marital Condition by Natural Divisions and Rural and Urban Areas.

CHAPTER VIII.—Education and Subsidiary Tables ... 79-88

Introductory Remarks—Reference to Tables—The Scope of the Returns—Extent of Literacy, General—Literacy by Natural Divisions—Literacy by Administrative Divisions—Literacy in Towns—Literacy by Age and Sex—Literacy by Religion—Literacy by Caste—Literacy in English—Progress of Education and Comparison with previous Censuses—How far Literacy once acquired is retained—Statistics of the Education Department.

CHAPTER IX.—Language and Subsidiary Tables ... 89-91

Reference to Statistics—Nature and Scope of the Return—Language spoken and their Classification—Dravidian Family, Malayalam, Tamil, Telugu, Tulu and Canarese—Other Languages.

CHAPTER X.—Infirmities and Subsidiary Tables ... 92-104

Opening Remarks—Reference to Tables—Relative Prevalence of the Infirmities—Insanity, accuracy of the return—Causes—Variation—Distribution by Age, Sex, Religion and Caste—Local Distribution—Lunatic Asylum and Lunacy Act—Deaf-Mutism, Nature of the Return—Causes and Variation—Distribution by Age, Sex, Religion and Caste—Local Distribution—Blindness, Correctness of the Return, Causes and Variation—Distribution by Age, Sex, Religion and Caste—Local Distribution—Ophthalmic Hospital—Leprosy, The Scope of the Return, Causes and Variation—Distribution by Age, Sex, Religion and Caste—Local Distribution—Leper Asylums and Leper Regulation—Elephantiasis, The Nature of the Return, Causes and Variation—Distribution by Age, Sex, Religion and Caste—Local Distribution.

CHAPTER XI.—Caste, Tribe, Race or Nationality and Subsidiary Tables and Glossary ... 105-115

General utility of the Return—Race and Tribe—Socio-Political Unrest and its results in the Caste System—Multiplication and Classification of

Hindu Castes—The Untouchables and the Depressed Classes—Mongolian Patch—Reference to Statistics—Hindu Castes—Variations in the Chief Castes, Nairs—Izhavas—Channan (Shanars)—Pulayan—Other Castes showing increase in their strength—Castes whose strength has decreased in the decade—Animists—Musalmans—Christians—Europeans and Anglo-Indians.

CHAPTER XXII.—Parts I and II—Occupation and Industries and Subsidiary Tables ... 116-146

Introductory—Part I Occupation—Reference to Statistics—Nature and Scope of the Return—Changes made in the Classification—General Distribution of Occupation and its Variations—Sub-Class I—Sub-Class II—Sub-Class III—Sub-Class IV—Sub-Class V—Sub-Class VI—Sub-Class VII—Sub-Class VIII—Sub-Class IX—Sub-Class X—Sub-Class XI—Sub-Class XII—Workers and Dependants—Occupation of Females—Partially Agriculturists—Rural and Urban Occupations—Distribution of Occupation by Religion—Occupation by Caste and its variation—Conclusion—Part II Factory Industries—Scope and Nature of the enquiry—Reference to Statistics—Number, classification and distribution of industries and the number of persons employed—Variation between 1911 and 1921—Organisation of Establishments—Place of Origin of Skilled Labour and their Number—Place of Origin of Unskilled Labourers—Distribution of certain Races and Castes in certain Industrial Establishments—Distribution of Adult Women and Children—Power used—Summary—Suggestions for the Future.

APPENDICES.

APPENDIX TO CHAPTER VI.—Special Enquiry into the size and sex Conditions of Families in Travancore and Statements.. 64-67

The Object and the Method of Enquiry—Number of Families dealt with—Size of Families—Sex of the First Born—Sex of Children born subsequent to the first—Determination of Causation of Sex—The effect of Vitality of Mothers on the Sex of Children Born—Conclusion.

APPENDIX I TO CHAPTER XII.—Non-Factory or Cottage Industries and Statements ... 147-150

Nature and Scope of the Enquiry—Paddy—Pepper—Ginger—Tapioca—Cocoanut and Oil—Coir Making—Toddy—Jaggery and Molasses—Mats, Baskets and Thatches—Arecanuts—Pottery, Bricks and Tiles—Leather Works—Dairying—Fishing—Weaving—Other Sundry Articles—Garden Products.

APPENDIX II TO CHAPTER XII.—Cattle Census and Statements. ... 151-153

Object and Method of taking the Census—Variation—Cows, Sheep and She-
Buffaloes—Milk Supply—Breeding and Maintenance of Cattle—Statistics of the Agricultural Department—Veterinary Hospitals and Cattle Farms

APPENDIX III TO CHAPTER XII.—Labour Census ... 154-157

Necessity for the Census—Scope and Nature of the Enquiry—Description and Name of Establishment—Demand for Labour—Density and overcrowding in cooly lines—Condition of Female Labour—Influence of Caste and Religion on Industrial Development—Movement of Labour—Rise in Wages—Organisation of Labour.

APPENDIX IV TO CHAPTER XII.—Internal Trade and Markets and Statements ... 158

Scope of the Enquiry—The number of markets from which Schedules were received and their classification—The amount of transaction Shops and Bazaars.

PAGE.

**APPENDIX V. TO CHAPTER XII.—The Economic Condition of
the People Statements ... 159-161**

General—Data required for finding out the value of property owned by the
People—The trend of the Economic Movement—Man versus Machine.

LIST OF MAPS.

LIST OF DIAGRAMS.

1-6. Showing the Proximity in Yards of the Population Enumerated from 1875 to 1921 ...	4
7. Density of Population from 1875 to 1921 ...	,
8. Proportion per cent. of Rural and Urban Population to the total Population, 1881 to 1921 ...	20
9. Showing proportion which the several religions bear to the total Population ...	34
10. Showing the relative growth of the 3 main Religions from 1881 to 1921 ...	35
11-14. Showing the proportion which males and females of each age period bear to their total population in each Religion ...	45
15-16. Showing the proportion in number in each Sex at various ages in 1901, 1911 and 1921 ...	46
17-18. Showing the ratio of proportional numbers of 1901 to 1911 bear to numbers at corresponding age periods in 1921 ...	46
19-22. Showing the variations in the number of females for every 1,000 males at each age period and in each main Religion ...	59
23-26. Showing the proportion of the Unmarried, Married and Widowed per 1,000 living in each sex, in each age period and in each main Religion ...	70
27-30. Showing the percentages of literates among males and females in each main Religion and age period ...	82
31. Showing the number of persons afflicted with insanity per 100,000 living at each age period ...	93
32. Showing the number of persons afflicted with deaf-mutism per 100,000 living at each age period ...	95
33. Showing the number of persons afflicted with blindness per 100,000 living at each age period ...	97
34. Showing the number of persons afflicted with leprosy per 100,000 living at each age period ...	99

INTRODUCTION.

Time and Date of Census.—The Census of 1921 is the sixth of its kind in this State, the first having been taken in 1875 and the others decennially from 1881. As the nature of the country does not admit of house-to-house visits being made during night, the usual time in India for taking Census, Travancore has been declared a “special tract” and treated as a “non-synchronous area,” with respect to other parts of India. The fact that the difference between synchronous and non-synchronous areas is only territorial and that it is made with the object of fixing a *time* for taking Census in the latter, different from that in synchronous areas, was not correctly understood; and in the last 5 Censuses, the final enumeration was taken at 3 different times, that of travellers at one time, of residents in houses and rest houses at another and of the inmates of hospitals, jails, etc., at a third. This defect was pointed out and remedied this time, and, with the sanction of the Census Commissioner for India, the final count was, throughout the State, made between 7 and 9 on the morning of the 18th March 1921. Thus, this is the first census which is synchronous throughout the State as regards both time and date and synchronous with the rest of India in respect of date.

2. Census Towns.—In addition to 19 Municipal towns, 19 other places declared Towns under the Police Regulation and provided with conservancy staff were censused separately this time.

3. Census Units.—In the last 2 Censuses, the Residential Village or Kara was taken as the unit of Census operations, both in rural areas and towns, as the Revenue Village or Pakuthi was too unwieldy to serve as a convenient Census unit. The kara whose boundaries, though undefined and unsurveyed, are said to be known locally, cannot be considered to be a satisfactory unit; and the belief in the infallibility of local knowledge as to its boundaries is shaken by the variations observed in the number of karas from Census to Census. But, for want of better unit, it has to be kept on, until the contemplated division of the Revenue villages into smaller areas, necessitated not only by Census but by administrative purposes, is accomplished in the next settlement. In Municipal towns, in the place of karas which formed the units of Census operations in previous years, well-defined wards into which the towns have been divided for administrative purposes were taken as units this time; and, unlike in previous censuses, the Presidents of the Municipal Councils were appointed Charge Superintendents.

4. House Numbering.—The agency employed for house numbering was the Village Revenue Officers for rural areas and the Municipal and Conservancy staffs for towns. Instead of preparing a house list for each unit and then extracting therefrom Block lists to be attached to Enumeration Books, Block lists were prepared at the first instance and kept ready for being stitched with the latter. The abstracts from house lists received from the Charge Superintendents were reviewed and abnormal variations in them were pointed out for explanation and necessary correction.

5. Enumeration Schedule.—As it is necessary for a province or state to know the number of persons that emigrate from it to other parts of India and other countries and as it is not possible to get returns of such emigrants from countries not under British Suzerainty, additional columns were opened in the Enumeration Schedule of this State to note the name, age, sex and destination of persons who have left the State since the last Census. Under the existing rules, the Superintendent of each province has to send to the Superintendents of other provinces, particulars of persons born in those provinces and enumerated in his own. It would enable comparison being made, if all the Imperial Tables of one province or state are sent, as they are prepared, to other provinces or states. Special instructions were issued to the enumerators to note, in the case of the Hindus, whether the person returned was a Malayalee or non-Malayalee, with a view to admit of separate statistics being collected for the former who differ from the latter in respect of habits, system of

marriage, law of inheritance, etc. The study of the demography of a tribe is, even in ordinary times, very interesting; and, in the case of the Malayalees, it is more so at present, as the effect of the Nair Regulation which was passed just a decade ago and of the advancement of education among their females, on their civil condition, birth and death rates, etc., may be studied. The mother tongue of the Malayalees being Malayalam, the language spoken by them might have been taken as the guide for classifying the Hindus into Malayalees and non-Malayalees. The inheritance followed might have also been taken. But, for the reasons stated in para 135, the language test cannot be trusted; and, as Marumakkathayam law of inheritance is followed by some non-Malayalees also, it was considered necessary to interrogate each Hindu enumerated whether he or she was a Malayalee or not and to make the entries accordingly. This being the first time when such an enquiry was made, it might have raised some suspicion in the minds of the people. On this ground and for reasons given in para 9 *infra.*, the number returned cannot be taken as absolutely correct. But the difference noticed between the Malayalees and the non-Malayalees, in respect of birth, death and fecundity rates and civil condition, amply justify the division.

6. Arrangements for Special Areas.—The Census of the railway travellers and employes was taken by the State agency, unlike in previous Censuses, when it was done by the railway authorities themselves. Special arrangements were made for the enumeration of travellers in frontier chowkeys, and, in order to prevent multiple or non-enumeration, tickets were issued to such travellers.

7. Preliminary Enumeration.—In this Census, for the first time, the employment of school masters as Enumerators and Supervisors was tried. As, on account of spread of education in the State, a large number of teachers, both of Sircar and Aided schools, was available, and, as they are generally more educated than the village officers who did the work in the last Census, this innovation was made. The number of enumerators employed was 9,147 against 1,666 in the last Census. Each enumerator had, on an average, 438 persons for enumeration, whereas in the United States of America, each was given 1,600 and in England, 1,030 persons, in the Censuses of 1910 and 1911, respectively. The time allowed for preliminary enumeration was a fortnight. In smaller towns, it was completed in a week, while, in outlying villages, it took about a month to finish the count. The time taken in the United States was also a fortnight for towns and a month for rural areas. The Charge Superintendents, many of whom had conducted the last Census, have given as their considered opinion that the work done by the school-master-enumerators was more efficient and that the figures collected by them were more correct, than those in the 1911 Census. The test schedules prepared by the Enumerators, after receipt of instructions from the Charge Superintendents, were checked by the Supervisors and the Charge Superintendents and then sent to the central office for review. The reviews were sent to the Charge Superintendents for information and guidance. They were also called upon to send abstracts of the results of the preliminary enumeration, with the number of persons, male and female, enumerated. They were reviewed in detail, and abnormal variations were pointed out for local inspection and modification, if necessary. It was this system that led to the detection of the abnormal variation in the population of the Trivandrum town in the preliminary enumeration, which was ordered to be re-done, on finding that the first enumeration had not been conducted properly. Arrangements were made for employing special clerks under Charge Superintendents for checking the enumeration books and correcting mistakes, if any, before they were issued for final counting.

8. Final Enumeration.—In the previous Censuses, the power of appointing enumerators and supervisors was with the Division Peishkars who correspond to the Collectors of British India. As a large number of such appointments had to be made in each Division, it was found in 1911 that, even a few days before the Final Census, all the appointments had not been made. This time, the Charge Superintendents were empowered to make the appointments themselves, and, before the Final Census day, statements of all the appointments made by them were called for and received in advance. The granting of this power was much appreciated by the Charge Superintendents and led to the fuller realisation of their responsibilities

It was the general opinion of the Charge Superintendents that, in this Census, their work was made much easier, that the instructions were exhaustive, and that they were received much in advance. The number of Enumerators and Supervisors, the majority of whom were Government employes, appointed for the final enumeration was 31,724 in all.

9. Attitude of the People.—The attitude of the general public was favourable towards the Census and the instructions issued to them not to leave their houses during the Census time were followed by them satisfactorily. There were no suffragists in the State like those in England who had left their houses and walked away during the Census of 1911; nor were there any non-cooperators who refused to give information, as in the present Census in certain parts of British India. As many as 15,679 private gentlemen have rendered assistance in the final enumeration. But, on account of the unrest, social, political and economical, which characterised the decade throughout India not excepting this State and especially of the direction it took (agitation for communal representation in public bodies) in Southern India, a tendency was shown by the members of certain castes here to return themselves as members of other castes. This was apparent, not only among the enumerated but also among the enumerators and copyists in the tabulation office.

10. Provisional Totals.—The Charge Superintendents were required to telegraph, one week before the Final Census, whether all the arrangements for the Census and for the receipt and communication of the Provisional Totals had been completed. They did accordingly. After the Final Census, the provisional totals were received promptly from all the Charge Superintendents, and the result was telegraphed to the Census Commissioner for India, within 15 hours of the taking of the Census, much earlier than it was done in any of the previous Censuses. That the promptitude with which the provisional totals were communicated did not in any way prejudicially affect the accuracy of the figures is evident from the fact that the difference between the Provisional and Final totals was only 96, the lowest figure ever observed, at any rate in the Census of this State.

11. Slip System.—Slip Copying was done in the last Census at the headquarters of Taluks, under the supervision of Tahsildars who were the Charge Superintendents. But, this time, it was conducted at the Central Office. The advantage of having trained and undivided control, under the direct supervision of the Census Commissioner, which is possible only in a Central Office, cannot be denied. As a number of educated persons were available, it was found possible to get the work done in the Central Office. The whole office was divided into 3 Sections and each Section was placed under a Superintendent, selected from among the officers having administrative experience. 285 Copyists were at work on an average per day. The average out-turn in copying was 414 per working day for each Copyist against 231 in 1911. Slip Copying was commenced on the 4th April and completed on the 18th June, 1921. Sorting was begun on the 4th July and finished by the 15th October 1921. The daily average number of Sorters on duty was 180. Compilation was started on the 16th October 1921 and closed by the 10th June 1922. It is the usual practice in all statistical operations, to tabulate for the smallest units at first and then go up gradually for higher units. However, on account of the re-distribution of Taluks and Divisions in the State which took place when the tabulation was going on, the usual order of procedure had to be reversed a little. The figures for the State were tabulated directly from those of the Pakuthies and the figures for the Divisions and Taluks were then compiled. The re-distribution of Divisions was sanctioned on the 12th January and of Taluks on the 16th June, 1922. This not only caused delay but also increased the volume of work. The Slip System was found to work as satisfactorily as could be expected of it, though it is doubtful whether it is the best system. The chances of mistakes occurring during Copying, Sorting and Compiling of slips are great and the chances of the pencil made entries in coloured paper becoming illegible by frequent handling, with fingers not always clean, and of losing the slips, greater. The subject will be dealt with in detail in the Administrative Volume. But, the system of having the work done in a Central Office has not been without its drawbacks. When a large number of

youths just out from schools, imbibed with democratic views and unaware of and unaccustomed to official discipline, are collected together, concerted action on their part becomes possible. When the Copyists came to know of the attempted strike in Madras for lower rates of out-turn and higher pay, they made a similar attempt here, which was, however, nipped in the bud. All the same, the time was one of much anxiety and uneasiness.

12. Special Census.—The question of the improvement of the material and social conditions of the people, which has been engaging the attention of the Public and Government for the last decade and the measures taken by them to further the object, demanded that enquiries should be instituted to collect information with regard to the extent of the improvement already made and its effects on the economic condition of the country. The opportunity of this Census was taken advantage of for the institution of such an enquiry; and special censuses were taken of Labour and Wages, of Markets and Internal Trade and of Size and Sex of Families, in addition to the Census of Cottage Industries and Cattle which was taken in 1911 also. An exhaustive questionnaire was drawn up for each special census and in the case of Labour and Wages and of Markets and Internal Trade, the Tahsildars, Presidents of Municipal Councils, Managers of Factories and Heads of Departments were required to collect information. The Census of Cattle and of the Size and Sex of Families was taken by the Revenue and the Town Conservancy staffs, and of Cottage Industries, by the preliminary Enumerators of the General Census.

13. Necessity for a Permanent Department of Statistics.—It must be remembered that, having regard to the volume of work involved in making the special inquiries and its importance, the information now gathered within the short time prescribed for the General Census, and by an inexperienced staff, cannot be expected to be complete and satisfactory. The only satisfaction is that a beginning has been made; and the inquiries require further development and completion in the intercensal period. In all progressive countries, arrangements have been made and are being made for the establishment of Permanent Bureaus of Statistics, with a view to develop and complete the inquiries made in one Census, to collect and collate figures for the use of the succeeding Census and to maintain Census records. The publication in a single volume of the Statistics found in the Administration Reports of the several Departments of the State, begun in 1921, is certainly an important step in the direction mentioned above, and the volumes so published were of immense use in the preparation of this Report. But, what is required is the development of the Section entrusted with this work on the lines of the Permanent Bureau of Statistics, established in the United States of America, and placing it in a position that would admit of facts and figures useful to the Public and Government, being collected and published periodically and of its being charged with the duty of taking the decennial Census. The practice of taking Censuses by staffs appointed temporarily for the purpose is considered unsatisfactory by eminent persons of Census experience both in India and other countries. One of them observes as follows “The accuracy of the entire Census of Population and Agriculture depends upon the efficiency of Supervisors. Their temporary employment is the survival of the former custom of creating a temporary organisation for each Census. Some time I hope the practice will be abolished and the work done by the regular trained employés of the Bureau (Permanent Census Bureau). Such an arrangement will not only reduce the expense but will greatly reduce the margin of error and advance the completion of the enumeration. To have this, the most important piece of Census work, done by temporary employés who have had no prior experience and who know nothing of Census taking, is, to say the least, very poor administration. The Director of the Census should have wide administrative experience and some knowledge in statistics. The greatest reductions on the number of enquiries should be made in the schedules for agriculture and manufacture. Details on these subjects can be developed at the mid-decennial Censuses. The entire omission of manufacture and of agriculture from decennial Censuses would be an improvement. It would certainly enable greater accuracy and more rapid work in the enumeration of Population.”

14. Publication of Report and Tables.—It was resolved this time to print the Report and the Imperial Tables in one Volume for several reasons. In the

first place, the matter for the Report has been compressed and made short as required by the Census Commissioner for India. Secondly, the publication of the Report and Tables in one Volume would facilitate reading and save the trouble of referring to one Volume for facts and another for figures. Lastly, such a publication is cheaper from an economic point of view. In writing Reports, to boil down large mass of materials without sacrificing important matter is indeed a difficult operation. As the present Report is addressed to the educated public supposed to have an acquaintance with Census, and as Census figures are usually known to be not meticulously accurate, the conclusions drawn and the inferences made from them should be considered only as approximations, though the caution is not inserted in every case. The re-distribution of Divisions and Taluks was effected during tabulation and the Government required to have the figures tabulated for the re-organised Divisions and Taluks. This necessitated the taking of Pakuthies which were not affected by re-organisation as units, instead of Taluks, as in previous Censuses. The number of Towns, each of which was treated as a unit, has also increased from 11 to 38. All these factors contributed to raise the number of units from 44 in 1911 to 473 this time, *i. e.* by 11 times, and to proportionately increase the volume of work. Had it not been for these circumstances, the whole work could have been finished earlier.

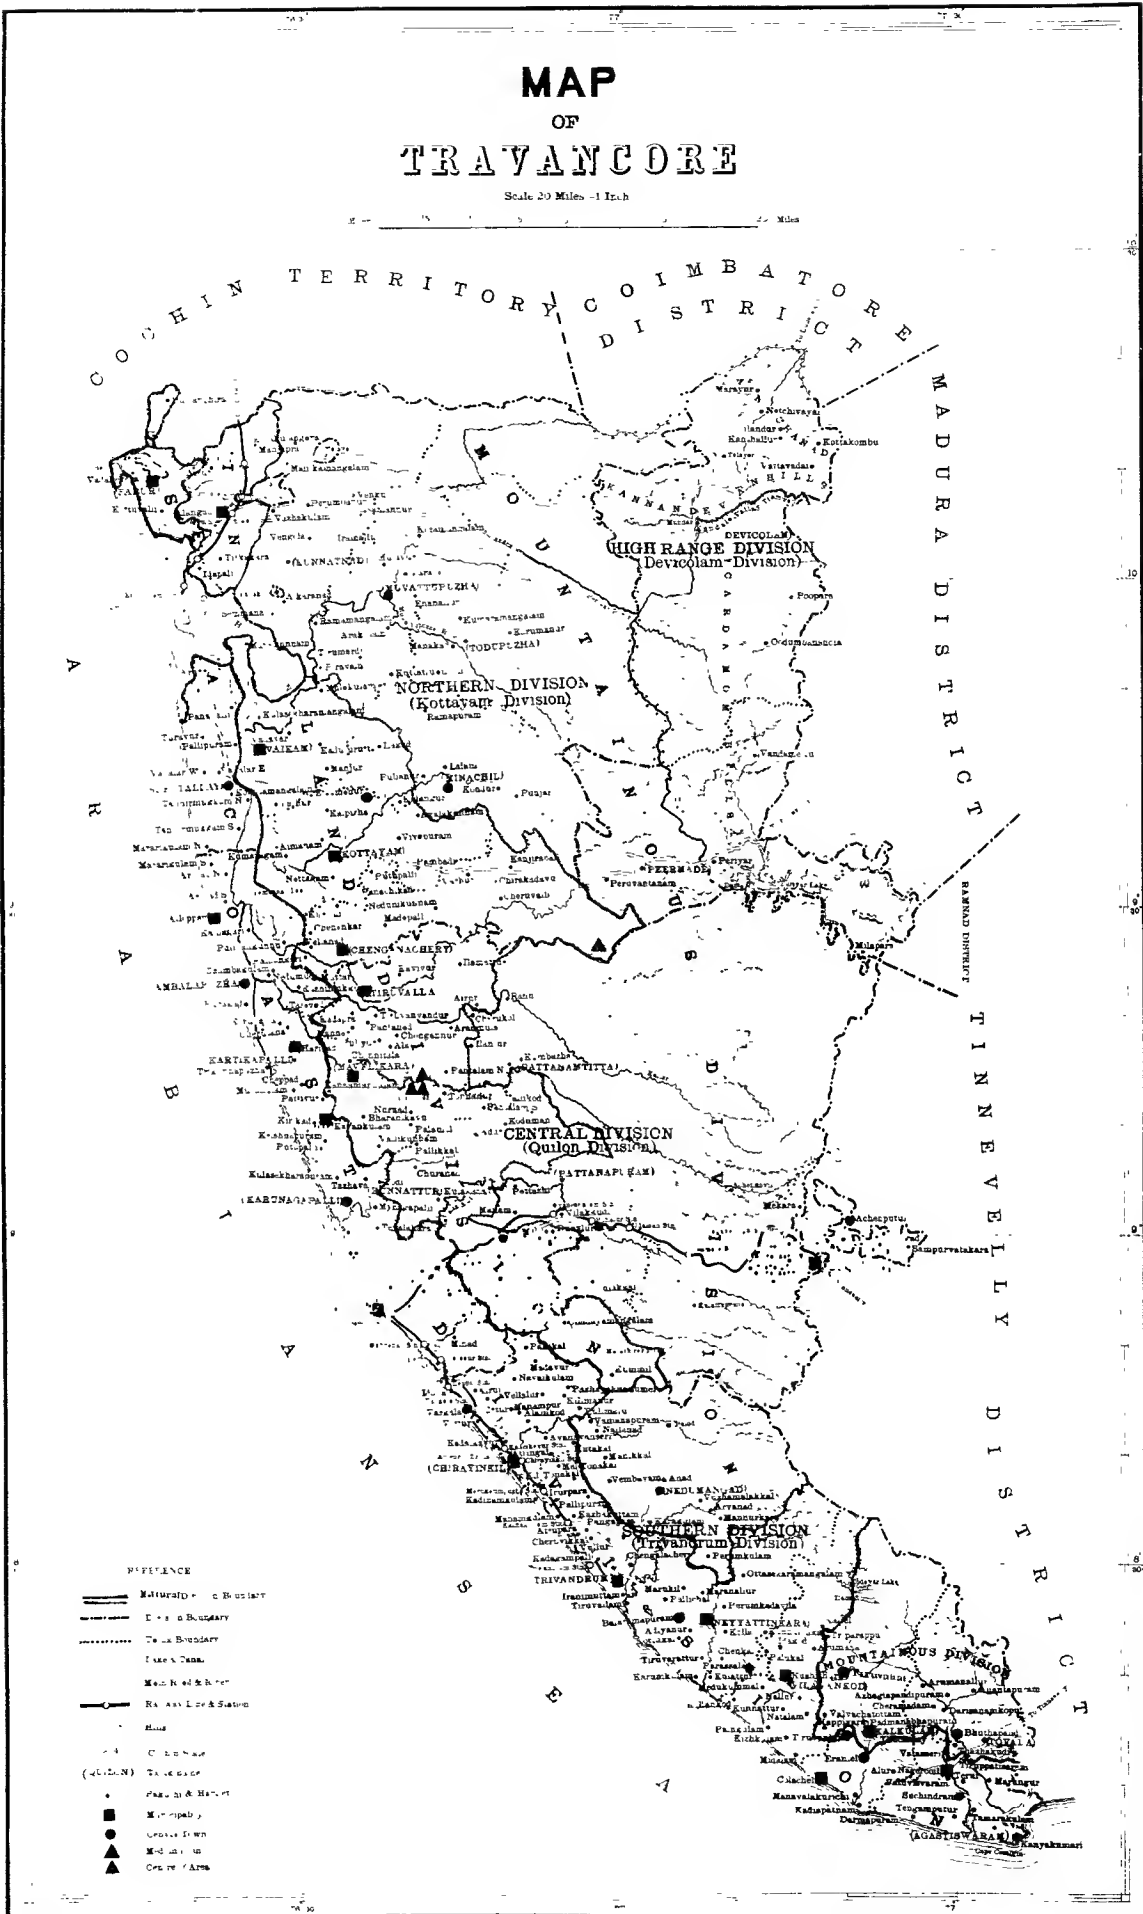

15. Acknowledgments.— My grateful acknowledgments are first due to Government of His Highness the Maha Rajah for the kind and sympathetic treatment accorded to me throughout the Census. Next to Government, the Director of Education is entitled to my thanks for having placed at my disposal the services of about 9,000 school masters for doing duty as Enumerators and Supervisors. That they have done their work satisfactorily has been certified to by all the Charge Superintendents. The Superintendent of the Government Press stands alone in claiming my special thanks. The number of forms and tickets printed goes to ten places of figures, most of them being of a complicated nature. The most important feature is that Mr. Chandy was able to utilise the unused Schedule forms for printing Sorters' tickets and Compilation forms and thus to contribute to the saving of Stationery. It was the practice in previous Censuses to have the Report and Tables printed in private presses. But, having regard to the promptness and satisfaction with which the forms were printed, I thought that the Report and the Tables also could be printed with advantage in the Government Press, as is done in other provinces in India, and made arrangements accordingly. I take this opportunity to thank Mr. Chandy for all the courtesy shown by him and for the satisfactory way in which he has executed the work. Coming to the officers in charge of the enumeration, *viz.*, Enumerators, Supervisors and Charge Superintendents, I have no hesitation in saying that they have done their duty well. To the Division Peishkars, the Commissioner of Devikulam and the Heads of the Police, Excise, Sanitary, Medical, Forest, Marine, Military and Public Works and other Departments, all of whom co-operated with me in bringing the enumeration work to a successful end, my grateful thanks are due. Among the Charge Superintendents, consisting of Tahsildars, Presidents of Municipal Councils and Deputy and Assistant Conservators of Forests, all of whom did good work, special mention must be made of M. R. Ry., Rao Bahadur K. A. Krishna Aiyengar Avl., President of Alleppey Municipal Council, for the interest and zeal he brought to bear upon the work and Messrs. E. Paramu Pillai and M. Subramani Aiyar, the then Tahsildars of Devikulam and Peermade, respectively, for the promptitude with which they got figures from distant and not easily accessible tracts of their taluks in the High Range Division and telegraphed them to me in time. Among the officers of the Census office, who have had to leave it before it was closed, Mr. R. Padmanabha Aiyar comes foremost. He was at first my office Manager and then my Personal Assistant. On account of ill-health, he had to sever his connection with the office as early as the 29th July 1921. In the formation of the office, in the printing and distribution of millions of forms, in the posting of nearly 10,000 enumerators, in the issue of instructions to the superintendents and in the drafting of the first part of the Census Code, his services were of immense value to me. Mr. Rangaswami Aiyengar of the Sanitary Department who first put into my head the idea of the utilisation of the services of school masters for enumeration was the Superintendent in charge of one of the sections of the Tabulation Office. Ill-health prevented him from continuing till the end. Messrs. Ganapathi Aiyar of the Sanitary, and Rajangom Aiyar of the Education

Departments, who were in charge of the other Sections of the Tabulation Office, continued throughout the period and did their work with great credit. Mr. C. John Jacob of the Sanitary Department was the Manager in charge of the Tabulation Office. It was entirely due to the tact displayed by him that when there were strikes among Copyists in other places and disturbances among school boys here, hundreds of Copyists and Sorters working in this office, all fresh from schools, having full sympathy with school boys and unaccustomed to official discipline, were kept at their work unmolested. Among the officers that remained throughout the period, Mr. Sanku Aiyar demands first mention. He was appointed as my Personal Assistant on the 9th August 1921. His services have been of use to me in ways too numerous to mention. He collected information for the Report and assisted me in drafting it. He has also seen the Report through the Press. The utilisation of his services in the Statistical section of the Secretariat where the Census Records are to be kept and where he can keep his knowledge of statistics current, will be of much use for the next Census. Mr. K. Ramakrishna Aiyar, a pensioned clerk of the Sanitary Commissioner's office, was taken here first as a clerk and then appointed as Head Clerk, on account of his experience in the last two Censuses. In fact, he was the only person in the office who had had any previous Census experience. It was due to his intimate knowledge of the villages that it was found possible to make adjustments for the re-organised Taluks and Divisions. Mr. S. Venketarama Aiyar has been in charge of Accounts and Records. That he was able to make payments in time to a large number of copyists and sorters is really creditable to him. For the preparation of the Subsidiary Tables, the number and complexity of which have considerably increased in this Census, Mr. Kesava Aiyar of the Education Department, who was drafted to this office, was entirely responsible and his work has been very satisfactory. He has got a head for figures and will be of use in the Statistical Department. Typist Padmanabha Aiyar did his work well. He types fast without mistakes. The other officers *viz.*, Messrs. P. S. Ananthanarayana Aiyar, A. S. Veeraswami Rajoo and R. Harihara Aiyar have been doing miscellaneous works, most of them of a complicated nature. Suffice it to say that the work of each one of them has been, without exception, up to the mark.

16. Census Expenditure.—As observed by my predecessor in his Report of 1911, no uniformity had been followed in the calculation of Census expenditure. The pay of the Census Commissioner was not included in the expenditure of 1901 Census; but, in the Census of 1911, the expenditure amounting to Rs. 4,026-0-0 incurred for the purchase of photographic outfits by the Survey Department, which retained them permanently for its use after the Census, was included. If the preparation of maps, etc., had been given to a private company, they would have charged for the work alone, and not for the machinery purchased. The amount spent by other departments of the State for purchasing machinery, temporarily for Census, and permanently for their own use, should not therefore be charged to the Census expenditure. The pay of the Census Commissioner is, on the other hand, a legitimate item of the Census expenditure, so long as he is in sole charge of the Census work. In British Provinces, the pay of Provincial Superintendents is fixed with reference to the importance and volume of the Census work, while, in this State, the salary varies according to the grade of the officer deputed for Census. Estimating the cost of printing maps at Rs. 1,000 and deducting the balance spent for purchasing the outfit from the total expenditure, the rate per mille of the population comes up to B. Rs. 21-4-0 in 1911. On similar calculation, the expenditure incurred in this Census up to the end of 1927 and including the budgetted allotment for 1928 works at the rate of Rs. 20-6-0. The details of the expenditure will be given, in their proper place in the Administrative volume. In Cochin, for 1921 Census, the rate was Rs. 24-1-0 and in England, for the Census of 1911, it was £5-8-8 or Rs. 81-6-0 in British Indian currency, for every 1,000 persons. In Madras the rate this time has more than doubled itself from that of the last Census. Despite the cost of living and the price of articles and wages, which have risen considerably during the decade, the enlargement in the scope and number of special Censuses taken *viz.*, from 2 in 1911 to 6 at present, and the increase in the number of units that had to be taken for tabulation, *viz.*, 11 times that in 1911, the rate of expenditure per mille of the population, has been kept down below that of 1911 must be considered to be the result of economical management.

REPORT

ON THE

CENSUS OF TRAVANCORE, 1921.

CHAPTER I.

DISTRIBUTION AND MOVEMENT OF THE POPULATION.

Foreword.—In the reports of 1901 and 1911, the distribution and the movement of the population formed the subject matter of two chapters, while, this time, they are required to be treated together. The portion relating to towns and villages, which was dealt conjointly with the distribution of the population in 1911, is given now a separate chapter. The subjects of distribution and movement are usually discussed at great length in Census Reports; and to group them together for combined treatment in a single chapter will have the effect of inordinately lengthening it. There is also in such grouping the difficulty of arranging the several paragraphs, as the headings of some of them will necessarily overlap one another involving repetition, which, in separate chapters, will not be striking. However, every attempt will be made to compress the matter as much as possible and present the several points in logical order. In making comparisons with other parts of India and countries outside, the latest available figures have been taken.

A. THE STATE AND ITS ADMINISTRATIVE AND NATURAL DIVISIONS.

3. Position and Boundaries.—In the scheme of Natural Divisions into which India is divided, Travancore occupies the southernmost portion of "Malabar

and Konkan" and exhibits in their maximum intensity all the characteristics, climatic and physical, of that Division. The area of the State is 7,625 square miles which is 31 square miles more than that in the last Census. The increase in the area is not the result of any change in the boundaries but the outcome of the survey of certain hill tracts left unsurveyed before; and it has no effect on the population. Two small tracts under the British Administration lie within the bounds of this State. They are Anjengo and Tangasseri and form the District of Anjengo. They cover an area of one square mile and return a population of 5,918 souls.

4. Administrative Divisions.—At the time of the last Census, there were in the State 5 Administrative Divisions and 33 taluks, the latter of which were increased by one in 1917. There was no change in their number when the present Census was taken; but, subsequently, the number of the Divisions was reduced to 4, and that of the taluks to 30. The Administrative Division of Padmanabhapuram was abolished and amalgamated with the Head Quarter Division of Trivandrum and the combined Division is called the Southern Division. Three villages covering an area of 31 square miles were taken from the Kottayam Division and included in the Quilon Division which is now named the Central Division. Six villages extending over an area of 210 square miles and which formed part of the Devicolum Division were transferred to the Kottayam Division, the designation of which is changed into the Northern Division, while the pruned Division of Devicolum is given the appropriate name of the High Range Division. The particulars of the component parts of each Administrative Division are given on the opening page of Part II of the Report.

5. Natural Divisions.—For the purposes of the census, the State was divided into two Natural Divisions, Littoral (Western) and Mountainous (Eastern). As, by such a division, a third part of the country lying between them and partaking of the characteristics of neither the one nor the other was left without separate treatment, and as it was seen from the Geological Survey of the State made after the last Census that the country was divisible into three distinct areas running almost parallel to one another from north to south and as they were also found to differ widely in respect of the class of people forming the majority of their inhabitants, and the occupations pursued by, and the diseases prevailing among them, it was decided this time to divide the State into three Natural Divisions, the Sea-Coast, the Inland and the Mountainous. The Sea-Coast Division, chiefly made up of sandy soil, recent sediments and Warkallai formation, has a rainfall of less than 70 inches. The majority of the Musalmans and the non-Syrian Christians in the State inhabit the Division. Cocoanut and rice are largely cultivated and Elephantiasis and Cholera are the prevailing diseases. In the Inland Division, the soil is of residual laterite. Tapioca, banana and yams are chiefly produced. The rainfall ranges from 70 to 110 inches. Ankylostomiasis (hook worm) and Yaws are the prevalent ailments. The Malayalee Hindus and the Syrian Christians form a large portion of the population. The Mountainous Division is characterised by hills and dales and given largely to the plantation of tea and rubber. The Non-Malayalee Hindus and the Animists form the bulk of the population. Malaria is the chief disease and gneiss the prevailing rock. The average rainfall is over 110 inches. The particulars of the taluks included in each Natural Division are given on the opening page of Part II of the Report.

6. Meaning of population Enumerated.—In filling up column 3 "name of the person" of the Schedule, during the preliminary enumeration, the name of the chief resident member of the family was entered first and then that of the other members, one by one. On the final enumeration, the chief man of the family was summoned and the names of the members of the household, entered in the Schedule, were read out to him. The names of the persons not present were struck off, and the names and all other particulars of new arrivals, entered. This time, through-out the State, the census was taken simultaneously, unlike on previous occasions when the final count was made in different places at different times. Thus, the population dealt with in this Census is the *de facto* population actually found and enumerated on the Census day.

7. Instructions to the Enumerators.—Complete instructions for enumeration were printed on this occasion on the wrapper of each Enumeration Book, so that they might be available for ready reference. In previous Censuses, it was the practice to print a portion of the instructions only on the wrapper and to issue the rest bit by bit. The enumerators themselves were, for the first time, in this Census, recruited mostly from school masters—who are generally more educated than village officers who did the work in the last Census—and the total number entertained for preliminary enumeration was 9,273 or more than 7 times the number employed in 1911. That, under the above circumstances, the figures obtained now are more accurate than in the previous Census, goes without saying; and the fact that the difference between the provisional and the final totals was only 96 proves the accuracy and care with which the work was conducted.

B.—AREA, POPULATION AND DENSITY.

8. Area and population of the State—The area of the State is 7,625 square miles and its population 4,006,062. It occupies the seventeenth rank among the Indian States as regards area, and third in point of population. It is the biggest among the Indian States of Madras, and, in extent, it is more than twice, and in population, thrice, the remaining States of that province put together. From the table

PROVINCE, STATE OR COUNTRY.	AREA.	POPULATION 000'S OMITTED.
<i>Travancore</i>	7,625	4,006
Baroda	8,127	2,127
Gwalior	26,383	3,195
Hyderabad	82,698	12,472
Kashmir	84,258	3,321
Mysore	29,475	5,979
Ceylon	25,481	4,504
Formosa (Japan).	13,944	3,654
Denmark	16,566	3,269
Norway	125,001	2,692
Switzerland	15,976	3,862
Wales	7,466	2,025
New Jersey (U. S. A.)	7,514	3,155

given in the margin it will be seen that, though Hyderabad, Kashmir and Norway are each more than eleven times as large as Travancore, Hyderabad is only thrice and Kashmir and Norway each three-fourths as populous as this State. Mysore, Gwalior and Ceylon are four times as extensive as this State, while the number of people returned there is only one and one-half, three-fourths and nine eighths, respectively, of that in Travancore. In size, Denmark, Switzerland and Formosa are each twice this State, but, the population enumerated in them ranges between 76 and 95 per cent. of that in Travancore. Lastly, Baroda, Wales and New Jersey, though each of them is equal in area to this State, have only between one half

and three fourths of its inhabitants.

9. Area and population of Administrative Divisions.—Taking the Administrative Divisions of the State and comparing them with the Madras Districts,

DIVISION, DISTRICT OR STATE.	POPULATION.
<i>Central Division</i>	1,487,178
Godavary District	1,470,863
Nellore ..	1,385,553
<i>Northern Division</i>	1,365,590
Chittoor District	1,269,157
South Canara.,	1,247,368
<i>Southern Division</i>	1,156,373
The Nilgiris District	126,519
<i>High Range Division</i>	56,621
Cochin State	979,089

it will be found from the table given in the margin that, in respect of population, the Central Division, comes just above Godavary District, the Northern Division occupies a place between Nellore and Chittoor, the Southern Division ranks below South Canara, and the High Range Division, the Hill Division of the State, takes a position next to Nilgiris, the Hill District of the Province of Madras. Cochin which is the most populous of the Madras States, except Travancore, returns only two-thirds of the population of the Central Division, one of the four Administrative Divisions of the State.

10. Density in General.—The density of population is defined as an abstract measure of the isolation, proximity or crowding of the population. The average density is a mere arithmetical expression, a variety of factors contributing towards the congestion of population in particular areas. As the nature of these factors has been discussed in detail in the Census Report of 1911, it is not proposed to traverse the same ground this time; but their influence will be noticed and discussed in respect of the areas, the density of which is found to have differed widely from the State average.

11. Density of the State and its variation since 1875.—According

PROVINCE, STATE OR COUNTRY.	NUMBER OF PERSONS PER SQUARE MILE.
Delhi	823
Cochin State	662
Bengal	608
Travancore State	525
United Provinces	426
Bihar and Orissa	409
Madras	297
Ratoda State	262
Other Indian Provinces and States	Below 250
Ceylon	177
Belgium	666
Holland	544
England and Wales	649
Germany	332
United States of America.	32
China Proper	197
Japan	295

to this Census, there are, on an average, 525 persons to each square mile of area. The statement given in the margin compares the average density of Travancore with that of other parts in India and other countries. It will be seen therefrom that, in India, the Province of Delhi, the Cochin State and the Bengal Province have each a greater density, while the other provinces and States occupy places below Travancore. Among the countries of Europe, all, except Belgium, Holland and England and Wales, are less dense than this State. The United States of America, Japan and China Proper have only 32, 295, and 197 persons, respectively per square mile.

DIAGRAM 7.—DENSITY OF POPULATION 1875 TO 1921.

The gradual increase of density of population in this State at each successive Census from 1875 is illustrated in the diagrams facing this page and in the margin. The figures in the last column of the table given below refer to the distance which would separate each individual inhabitant from his nearest neighbour, if all were distributed at equal intervals over the whole surface of the country.

YEAR OF CENSUS.	PERSONS PER SQUARE MILE.	ACRE PER PERSON.	PROXIMITY IN YARDS.
1875	303	2.1	110
1881	314	2.0	103
1891	335	1.9	96
1901	387	1.7	92
1911	449	1.4	84
1921	525	1.2	76

12. Density of the natural Divisions and its Variation since

STATE OR DIVISION.	NUMBER OF PERSONS PER SQUARE MILE.		PERCENTAGE OF VARIATION.
	1911	1921	
State	449	525	16.9
Sea Coast	1,102	1,266	14.8
Inland	718	832	15.8
Mountainous	164	200	21.9

1911.—The density of the Natural Divisions in 1911 and 1921 and the percentage of its variation between the two Censuses are shown in the statement given in the margin and illustrated in the map found opposite to page 10. It will be seen that the differences in the density alone, leaving those in other matters, observed among the three Natural Divisions, amply justify and even necessitate the

To face page 4

Diagrams 1 to 6 showing the Proximity in Yards of the population
enumerated at each Census from 1875 to 1921

Scale 4" to 1 mile.

division of the State into three Natural Divisions. The density of the Inland Division, standing midway between that of the Sea-Coast and of the Mountainous tracts and connecting the two, was found merged in that of the two Natural Divisions into which the State was divided in the previous Censuses.

13. Sea-Coast Division.—The density of the Sea-Coast Division is the highest, being one and a half and six times that of the Inland and of the Mountainous Division, respectively. The reasons for the highest density obtaining in the Sea-Coast Division are obvious. The important factors that determine density are in full operation in this Division. The sedimental and alluvial soil, spread on a flat surface, permitting almost every inch of it to be brought under cultivation, and the provision for irrigation on a large scale, have contributed to the extensive cultivation of paddy and cocoanut, in this Division. The water-ways in the north and the large number of roads and the Railway in the south have made transport easy and cheap. The historic considerations, such as the situation of the Capital of the State and the residences of Royal families, the location of important public institutions, the existence of a sea board and of many trading centres and markets have also largely contributed to the density of the Division. The absence of association between density and rainfall is illustrated and the neutralisation of the effects of scanty rainfall by irrigation is exemplified more in this than in any other Natural Division.

14. Inland Division.—The Inland Division, characterised by scattered villages and isolated homesteads, inhabited chiefly by the Malayalees and enjoying freedom from epidemic diseases, with a soil admitting mostly of the cultivation of garden products and tapioca, having a good and healthy climate and equable temperature—neither hot like the Coast nor cold like the Mountainous Division—traversed by a large number of navigable rivers affording convenient and cheap transport but possessing no large industries capable of attracting many settlers, has a density, chiefly contributed by the natural increase of the people, standing midway between that of the coast and the Mountainous Division.

15. Mountainous Division.—The Mountainous Division has the lowest density. The soil of the Division and the amount of rainfall are highly favourable for the cultivation of tea and rubber. The tract abounds in water falls a few of which have already been harnessed and pressed into service for the manufacture and transport of these products. The density of the Division is mainly contributed by immigrant population.

16. Variations between 1911 and 1921.—The variation in density between the last and this Census is most marked in the Mountainous Division where it is much higher than the average for the State, while it is below the State average in the other Divisions. In the Mountainous Division which is being fast opened up, the extended cultivation of tea and rubber has drawn a large number of immigrants from the low-country and from across the ghats. The rate of increase is naturally the lowest in the Coast Division where the population is most congested and where there is not much room for expansion.

17. Density and its Variation in the Administrative Divisions.—The density of the Administrative Divisions and its variation since 1911 are shown in the statement given in the margin and in the map found opposite to page 10. The variation is the highest and most marked in the High Range Division which embraces within it most of the mountainous regions of the country referred to in the preceding paragraph. The Northern Division from which a large number of persons have emigrated to the tea and rubber plantations of the High Range tract, has naturally the lowest variation.

STATE OR DIVISION.	NO. OF PERSONS PER SQ. MILE		PER-CENTAGE OF VARIATION.
	1911.	1921.	
State	449	525	16.9
Southern	663	776	17.0
Central	490	574	17.0
Northern	467	539	15.4
High Range	36	51	41.7

18. Pressure of Population.—The pressure of population, by which is meant the pressure on the means of subsistence, depends upon various factors such

as the density and the rate of increase of population and its standard of living, and the resources available for raising wealth and converting it into the necessities of life required by that standard of living. Not only has the population of the State been increasing by rapid strides during the last three censuses but its standard of living has also been rising. Rice has been the staple food grain of the country from time immemorial, but it has never been produced in sufficient quantities to meet fully the requirements of the population, on account of the limited area fit for its cultivation ; and the rice out-put of the country is supplemented by import of the grain from outside and by other local articles of food like fish and tapioca. The cultivation of tapioca which was introduced into the country about a generation ago and which grows even on poor and unirrigated soils has been rapidly extending in recent years. No organized attempt had been made in the past to collect statistics of rice and other food stuffs grown in the country and the proportion of the population served by them. Even after the last Settlement operations, when the area cultivated under rice was determined and the number of cocoanut, jack and other trees counted, and, until very recently, no provision was made for the conduct of field-to-field crop inspection or for the maintenance of records showing the area actually cultivated, the crops raised, their yield, etc. In the absence of such statistics, there is no correct means of accurately measuring either the progress made in the cultivation of paddy or the proportion of the population whose needs it can meet. The figures forming the basis of the present discussion can only be taken as roughly indicating the trend of events.

19. The steps taken during the decade for meeting the increased demand.—The steps that are generally taken to meet the demand for the subsistence of a growing population are :—(a) The opening up of fresh lands for the cultivation of the staple articles of food and (b) improving the out-turn of the soil by improved and scientific methods of cultivation. The decade under review is marked by considerable activity in both these directions. The State Department of Agriculture which was organised thirteen years ago, was considerably strengthened and did much to popularize improved methods of cultivation and improved manures, while the Department of Co-operative Societies was newly organised to help the ryot to find money easily for cultivation. Two hundred and twenty six Societies were brought into existence and 36 experimental and demonstrational agricultural farms were opened and worked. 68,124 acres of land were additionally brought under paddy cultivation showing an increase of 11 per cent. over that cultivated in 1911 and 236,169 acres of land were double cropped against 198,400 in 1911. The area under tapioca at the end of the decade was as large as 404,092 acres. The irrigation canals were extended by 35 miles during the decade. The available statistics indicate a slight fall in the yield of paddy per acre in the decade as compared with the yield in the previous one. This is apparently due to the extension of paddy cultivation to new soils lying on the economic margin and the increasing difficulty in procuring manure leaves on account of the opening up of the low country wooded areas for cultivation of tapioca and such industrial crops as cocoanut, pepper and rubber. The yield of paddy per acre in the decade was however higher than that in British India and it is certain to increase with the larger adoption of the improved methods and manures demonstrated by the Agricultural Department.

That the material prosperity of the people is on the advance will be seen from the fact that they have been able to import rice in this decade exceeding by 29 per cent. the average annual quantity imported in the previous decade, at a cost much higher than that obtaining in 1911 and that they have been able to make remarkable advances on the cultivation of the chief industrial crops of the country, namely, cocoanut, rubber, pepper and tea to the extent of 444,010, 51,469, 48,762 and 62,659 acres, respectively. The tapioca raised in the country has been sufficient for export after meeting local requirements. The industry of fish has also considerably advanced. After supplying the increased local needs, the average quantity exported has risen from 133,175 cwts. per annum in the last decade to 192,571 in the decade under review, *i. e.* by over 44 per cent. The export of cocoanut and its products, copra and oil, has increased by

about 15 per cent. Similarly, the average annual export of pepper and tea which was 20,528 candies and 12,305,897 lbs. in the last decade has risen now to 30,083 and 18,544,659, (*i. e.*) by 47 and 51 per cent., respectively. The export of rubber during the decade has been on an average 2,332,149 lbs. per year. The number of factories in the State which stood at 68 at the end of 1911 has risen to 143 in 1921 and the number of Joint Stock Companies has increased from 130 at the commencement of the decade to 190 at its close, circumstances proving that the country is tending to become industrial. A Department of Industries was also organised in the decade.

C. THE MOVEMENT OF POPULATION.

20. Variation in population at previous Censuses.—The statement

CENSUS YEAR.	INCREASE OVER PRECEDING CENSUS.	
	Number	Per cent.
1875	2,311,379	..
1881	2,402,158	3.9
1891	2,557,736	6.5
1901	2,952,157	15.4
1911	3,428,975	16.2

given in the margin shows the population enumerated in previous Censuses and the rates of increase. There was no change in the area dealt with; and emigration and immigration being limited, they had very little share in the causation of the variation. The continued increase observed must therefore be considered natural, being the excess of births over deaths.

21. The increase is normal under the conditions of the State.—When the rate of increase in the population enumerated in 1901, *viz.*, 15.4 per cent. was found to be more than that recognised to be the standard during normal years in the Madras Presidency, arguments were brought forward and figures collected not only to prove that there was under enumeration in 1891, but also to determine what the actual number of omissions in the enumeration was, which, if added to the figures of that year, would just give the standard rate of increase for 1901. However, in the next Census, 1911, the increase was 16.2 per cent. over the actual figure of 1901. It was then explained that there was no reason to doubt the accuracy of the figures, and that the increase was normal, being the result of the conditions that obtained in the State.

22. Conditions which obtained in the State tending towards the increase of population.—The majority of the population of the State are the Hindus of whom the Malayalees form the bulk. They are a separate tribe of the Dravidians differing in habits, mode of life, marriage customs, law of inheritance, etc., from other Hindus. Bodily cleanliness is their chief characteristic feature; and as they live in isolated houses surrounded by gardens, they are protected from the attacks of air borne infectious diseases. They are very particular about their food, especially drinking water, which they boil well before using. These wholesome habits, in themselves, give them sufficient protection from the attacks of air and water borne diseases, which, on account of overcrowding and polluted water supply, prevail more than any other disease in India. To improve public health further, Government organised a separate Sanitary Department as early as 1895 *i. e.*, 5 years before the 1901 Census, and, ever since that time, public health had been steadily improving producing results in proportion to its activities, as the Census figures of 1901 and 1911 testify. At no time did famine affect the State seriously, and never to the extent to which the rest of India had suffered. Plague which had carried away 25 millions of people from other places in India during the last two decennia had not set its foot within the State. Big towns were brought under Municipal Regulation and villages each with a population of 1,000 and more, were provided with sanitary staffs, for attending to the cleanliness of the places. Sanitary arrangements were made for all fairs and festivals where people gathered, and epidemic diseases which were once prominent on these occasions, became conspicuous by their absence.

23. The Conditions of the Decade under Review.—The decade under review is characterised by the many sided activities of both the people and the Government towards the development of the material prosperity of the State. Public health has been more satisfactory than in the previous decade. The average annual number of deaths from Cholera and Small-pox, which stood at 2,989 and 3,221 in the last decade, has fallen down to 1,107 and 1,716, respectively, in the present one. Vaccination has made good progress. Both Primary and Re-Vaccinations have been made compulsory among pupils attending schools and Government employes. As this State occupies a prominent place in the matter of education among the Provinces and States of India, and as the number of pupils attending schools here is fairly large, a high proportion of the children susceptible to small-pox is given protection. By the practical demonstration of immunity from Small-pox afforded to a large number of students, vaccination has to a certain extent become popular and is not now viewed with suspicion by the illiterate public. Plague has been kept out; and Influenza, to which about 6 millions of people succumbed in places outside Travancore, affected the State only lightly and was not attended with high mortality. Some scarcity was felt, though not actual famine, in the middle of the decade, caused more by world conditions than by failure of crops; but, tapioca which was extensively cultivated within the State met largely the needs of the poor, and averted the calamity which would have otherwise seriously afflicted the people.

The Municipal Regulation was extended to 12 more towns. The sanitary staffs of the rural areas were strengthened and 20 new Hospitals and Ayurvedic Dispensaries were opened. Education advanced considerably and the percentage of literates in both the sexes put together rose from 17 to 27 and that in females alone from 6 to 17. This is a noteworthy feature from the point of view of public health, since infants are better looked after by educated mothers and infantile mortality is found to be lower among children of the educated classes.

The improvements made in the decade in connection with agriculture and industries have been mentioned in para 19 *supra*.

The railway was extended by 38 miles and brought to the Capital of the

PROVINCE OR STATE.	AREA.	NUMBER OF MILES OF ROAD.	AREA IN SQUARE MILE SERVED BY ONE MILE OF ROAD.

Central Provinces	99,876	7,993	12·5
Burma	230,439	12,541	18·4

State and 181 miles of roads were opened. In the matter of communications, Travancore, as will be seen from the statement given in the margin, occupies the foremost place in India. Motor Buses and Cars to the number of 587 were imported and used for traffic. The volume of trade increased considerably and the average annual value of exports and imports rose from Rs. 242 and 142 lakhs in the previous decade to Rs. 484 and 318 lakhs, respectively, in the present one.

24. The Movement of Population and Accuracy of figures returned.—The population enumerated in this Census shows an increase of 16·8 per cent. over that in the previous one. While the preliminary enumerations of 1901 and 1911 were made by 750 and 1,294 paid private enumerators and village officers, respectively, the first count of this Census was carried out by 9,273 subordinate officers of whom 8,644 were school masters of Government and Aided institutions. The Charge Superintendents, many of whom had previous census experience, have certified to the efficiency of the work turned out by the school-master-enumerators and the accuracy of the figures obtained by them. It need hardly be stated that school masters are, as a class, better educated and disciplined than either

village officers or paid private persons. That, in the three successive censuses, when enumerations were conducted by three different agencies, there has been an uniform increase of between 15 and 17 per cent. proves not only the reliability of the figures but also the normality of the rate of increase for the State.

25. Migration.—The number of immigrants as found this time by enumeration was 73,591, against 61,165 in the last Census. Deducting from this the number that must have died during the decade at 20 per mille, the number of survivors from the previous decade would come to 48,935. Thus, the number of fresh immigrants during the last decade amounts to 24,656. Returns of persons born in Travancore and enumerated elsewhere have not been received from all Provinces and States. But, as stated in the Introduction, additional columns were opened in the enumeration Schedules of this State for noting down the number of persons born in Travancore but had left the country since the last Census. From the information so obtained, it is seen that, during the decade, 9,342 persons have left the State. Setting this number against the number of fresh immigrants, it is observed that the State has had a net gain of about 15,000 persons. This number reduces the rate of increase by 0·4 and the balance of increase 16·4 per cent. is made up of the excess of births over deaths.

26. The increase depends chiefly upon Public Health and Economic conditions.—The percentage of increase varying from 15 to 17 found in the last three Censuses, is not after all too high and unworthy of belief, though such a rate is not very common in the rest of India. But, in European countries, America and Japan, such increases are normal. The rate of increase depends chiefly on the state of public health and the economic prosperity of the people, and, in any country where both these are satisfactory, the above rate should be considered normal.

27. Vital Statistics.—There was no regulation in the State for the compulsory collection and registration of Vital Statistics in the rural areas, the one now in force having been passed only at the end of the decade under review. The work was being done by the village officers under the executive orders of Government. As already pointed out in the Introduction, an average village under a pakuthi officer is too big to serve as a convenient administrative unit. Hence the birth and death figures collected for the rural areas, where about 90 per cent. of the population live, cannot be supposed to be accurate. According to the Vital Statistics registered during the decade for the whole State, the excess of births over deaths comes to 141,088, which is just a quarter of the increase shown in the Census. As regards the Municipal towns, however, where the registration is compulsory, the figures collected are more or less correct. It must be stated that, in India, among the Hindus, the chances of deaths escaping the notice of the Registering Officers are fewer than those of births. Therefore, the deaths registered may be taken as accurate. In the 14 Municipal towns, where the registration of Vital Statistics is compulsory, (excluding the 5 major Municipal towns, where there are hospitals admitting a large number of inpatients from outside, and, in the mortuary returns of which deaths occurring among those inpatients are also included), the number of deaths registered during the decade gives, on the population taken after the Municipal Regulation was extended to them, a rate of 20 per mille. The number of deaths in the rural areas will be lower than that in towns, and consequently the death rate in those areas must be lower than 20. Working on the method adopted by Mr. Hardy for finding the mortality rate from Census figures, the death rate during the decade comes to 17 per mille, per annum. So, the death rate for the State may be put down at 20. The average rate of increase for the State calculated from the difference between the Census figures of 1911 and 1921, comes to 15·7* If the death rate be 20, as determined above, to give an increase of 15·7 per mille, the birth rate must be

*If P = Population at any Census, P^1 = Population at the succeeding Census, r = Annual rate of increase per unit of population and n = The intercenal period. $P^1 = P(1+r)^n$. Taking the Log of each side of the equation $\log P^1 = \log P + n \log(1+r)$. (i. e.) $n \log(1+r) = \log P^1 - \log P$. (i. e.) $10 \times \log(1+r) = \log 4,996,962 - \log 3,428,975$.

$\therefore 1+r = 1.0157 \therefore r = .0157$

\therefore rate per mille = 15·7

about 35. That this is the normal birth rate of the country will be clear from the consideration of the following facts. The number of births depends upon the number of married females in the reproductive ages of 15 to 45. The number of married females of those ages, at the commencement of the decade, was 598,142. At the rate of 247·5 births for 1,000 wives, as found to be the case in India (*vide.*, para 762 of 1901 India Report), the number of live births comes to 148,040. This gives a birth rate of 43 per mille on the 1911 population. As, however, during the decade, the number of marriages in the early ages has decreased, the fecundity rate also must have gone down. The birth rate can, therefore, be safely put at 35. For a country where the increase from Census to Census is 15 to 17, the birth rate of 35 and the death rate of 20 may be considered normal.

28. Movement of Population in the Natural and Administrative Divisions.—In the statement given in the margin and in the maps found on the opposite page, the population of the Natural and Administrative Divisions in 1911 and 1921 and the rates of increase are shown. The rate of increase in the Coast

STATE OR DIVISION.	POPULATION.		RATES OF VARIATION BET- WEEN 1911 AND 1921.
	1911.	1921.	
State	3,428,975	4,006,062	+16·8
Coast	1,582,739	1,817,745	+14·8
Inland	1,078,447	1,250,130	+15·9
Mountainous	767,789	938,187	+22·2
Southern	987,952	1,156,373	+17·0
Central	1,270,907	1,487,178	+17·0
Northern	1,130,027	1,305,590	+15·5
High Range	40,089	56,921	+42·0

Division is the lowest; and it is lower than the State average. This is due to the movement of the people from the Coast where struggle for life is naturally keener to the Inland and Mountainous Divisions where the tea, rubber and cocoanut estates and the virgin waste lands afford lucrative occupations. The lower rate of increase in the Inland Division, must be attributed to the lower

birth rate obtaining among the Malayalee Hindus who form the bulk of the Hindu population there. Taking the Administrative Divisions, the high increase observed in the High Range Division and the low increase found in the Northern Division may be the results of the causes mentioned in para 17 *Supra*.

D.—THE MEDIAN POINT AND THE CENTRE OF AREA.

29. The Median Point and Centre of Area.—The median point of population in the present Census and the last two Censuses and the centre of area of the State, have been determined, for the first time, on the lines described in the Census Report of the United States of America for 1911. The north to south and the east to west lines running parallel to the Longitudinal and Latitudinal lines and dividing the State into parts of equal population and area, respectively, were drawn, and the points of intersection of those lines noted. The point of intersection of the lines dividing the area of the State into two equal parts is called the Centre of Area while the intersecting point of the lines which divide the State into two parts of equal population is designated the Median point. In the map of Travancore found at the beginning of the Report, these points are marked.

30. The Position of the Centre of Area of the State and the Median Point of Population.—It will be seen from the map referred to in the above para that the Centre of Area is situated on a point 9° 25' 40" North Latitude and 76° 51' 00" East Longitude. The point is seven and three-eighths miles to the South of Munda-kayam. The Median Point of population of 1901 fell on a point 9° 14' 10" North Latitude and 76° 41' 10" East Longitude, which is one and five-eighths miles to the west of the Main Central Road and seven and three-eighths miles to the east of the town of Mavelikara. In 1911, it shifted to a point 9° 13' 30" North Latitude and 76° 40' 10" East Longitude. It is three and three-eighths miles west of the Main Central Road and six and one-fourth miles east of Mavelikara. In the present Census, the point has moved eastward and lies on 9° 13' 30" North Latitude and 76° 41' 40" East

Density.

Variations in the period 1911-1921 as the number of persons per square mile added to the number then recorded are shown thus:--

Population.

Variations in the period 1911-1921 as a percentage of increase on the population of 1911 are shown thus:--

Longitude. This is one and a half miles west of the Main Central Road and seven and three-fourths miles east of Mavelikara.

The movement of the population discussed in the earlier paragraphs is only local and refers to its movement between Taluks and Divisions. It may be compared to the movements of the satellites of the sun (planets) in the Solar System. The movement of the median point described above refers to the entire population and may be compared to the movements of the sun and his family in the Stellar System. The median point during the last 30 years has been moving between $76^{\circ} 40' 10''$ and $76^{\circ} 41' 40''$ East Longitude, and between $9^{\circ} 13' 30''$ and $9^{\circ} 14' 10''$ North Latitude.

E.—HOUSES AND FAMILIES.

31. Houses in the State.—The definition of a house is the same as in the last Census. It is as follows:—

A House is the dwelling place of one or more families with their resident servants, having a separate principal entrance from the common way.

NOTE.—(a) The common way is not necessarily a public way. Thus, servants' godowns in the compounds of large houses, and separate houses situated in one compound, which have generally no separate entrances from a common way or yard, should be treated as distinct houses.

(b) If two or more separate families who do not take their meals together, live in different rooms of the same house, these different rooms will not be taken as separate houses but only as one house.

(c) Two or more distinct but contiguous buildings belonging to the same owner but let out to different families will be taken as different houses.

(d) Jails, hospitals, dispensaries and similar institutions which comprise several detached buildings should be entered only as one house.

The disposition of houses in the taluks of Shencottah, Thovala and Agasteeswaram and in certain parts of the towns is in streets, while, in the other taluks and rural areas, the houses are situated in isolated compounds and lie scattered over the whole area without order or arrangement. The number of occupied houses has risen from 663,153 in the last Census to 761,827 in the present one, showing an increase of 14.9 per cent., while the growth of population is 16.8 per cent. The absence of any provision in the enumeration Schedule to enquire and note whether the houses are pukka or kutcha, tiled or thatched, is indeed a drawback, as, for want of such information, one of the valuable tests to measure the prosperity of the people and ascertain the way in which increased wealth is utilised is lost. On an average, there are 100 houses per square mile, against 87 in the previous Census. The mean distance from one house to another has decreased by 26 yards, the distance in 1911 and 1921 being 202 and 176 yards, respectively.

32. Houses in Natural and Administrative Divisions and in Towns and Rural Areas.—Taking the Natural and Administrative Divisions, it will be seen from the table given in the margin that the increase in the number of houses is more or less in proportion to that of population in the Sea-Coast and Inland Natural Divisions and in the Central and Northern Administrative Divisions. The low

DIVISION.	OCCUPIED HOUSES IN 1921.	VARIATION FROM 1911 PER CENT. + OR -.	VARIATION IN POPU- LATION. + OR -.
Sea-Coast	340,903	+ 12.2	+ 14.3
Inland	234,951	+ 15.0	+ 15.8
Mountainous	185,972	+ 19.9	+ 22.2
Southern	215,326	+ 13.8	+ 17.0
Central	281,714	+ 15.4	+ 17.0
Northern	252,946	+ 13.9	+ 15.5
High Range	11,841	+ 53.2	+ 42.0

increase in the Southern Division is mainly due to the fact that fishermen who catch fish in the sea and who form a large part of the population of the Division do not feel the necessity for any increased accommodation, as houses are used by them more as places of meeting than of living, the men spending their nights on Catamarans catching fish and the women spending their days in markets selling them. In the

case of the Mountainous and High Range Divisions, the high increase is due to the additional accommodation provided for the large number of permanent coolies employed in the tea and rubber estates of the Divisions.

33. House Room and Family and their variation.—A matriarchal

DIVISION,	NUMBER OF PERSONS PER HOUSE.	
	1911.	1921
Sea-Coast	5.2	5.3

Northern	5.1	5.2
High Range	5.2	4.8

family consists of an uncle (Karnavan), his sisters and brothers and sisters' children while a patriarchal family is made up of a father, mother, sons and unmarried daughters. There has been very little change in the latter family system, while, in the former, the tendency of late has been for the daughters to go and live with their husbands and the sons to separate themselves from their *tarawads* and

set up independent establishments for themselves, their wives and children. The average number of inmates in a house has increased from 5.2 in the last Census to 5.3 in the present one. In towns, it has risen from 5.4 in 1911 to 5.6 at the present Census and, in Rural areas, from 5.1 to 5.2. From the table given in the margin, it will be seen that the variation in the number of persons per house has been more or less uniform in the Natural and Administrative Divisions, except in the High Range Division where on account of the increased accommodation provided for coolies, the average has fallen a little.

CHAPTER II.

THE POPULATION OF CITIES, TOWNS AND VILLAGES.

34. Preliminary observations.—The distinction made between Urban and Rural areas has never been clear in any country, and least so in this State. In determining whether a place should be treated as a town or not, the basis that is generally followed is population. It is doubtful whether this basis has been taken into account in Travancore in the selection of places for towns. There are several Municipal towns in the State each with a population less than that of a village, and there are likewise several villages more populous than towns. In the United Kingdom, places each having a population of 2,000 and more are treated as towns, while, in the United States of America, the minimum number of inhabitants for a town is 2,500. In a country like Travancore, where, unlike in other parts of India, the chief amenities associated with urban life, *viz.*, markets, better class of schools, public institutions, etc., are found in almost every village, places each with a population of 2,000 may be declared towns. There are in this State 444 such places, and their aggregate population amounts to 1,750,916. This, with the existing urban population of 404,654, bears a ratio of 54 per cent. to the total population of the State, while the proportion in the United Kingdom is 78 and in the United States of America, 46. If 5,000 inhabitants be fixed as the minimum for constituting a town, as in other parts of India, the urban population of the State comes to about 14 per cent of the entire population, while the proportion in the whole of India is 9 per cent.

35. Reference to Tables.—The following tables have been referred to in the treatment of the subject in the Chapter.

Imperial Table. I. Area, Houses and Population.

III. Towns and Villages classified by Population.

IV. Towns classified by Population with variation from 1881.

V. Towns arranged territorially and Population by Religion.

Subsidiary Table. I. Distribution of the Population between Towns and Villages.

II. Number per mille of the total population and of each main Religion who live in Towns.

III. Towns classified by Population.

36. Villages.—The residential villages known as Karas or Muris have been taken, as in previous censuses, as units for the enumeration purpose, on account of their compactness. These villages being of ancient date, their boundaries, though undefined, are said to be known locally. The revenue villages or pakuthies which have defined limits are artificial units of inconvenient sizes. They are too large to serve as satisfactory units either for census or for administrative purposes. A village intermediate in size between a kara and a pakuthy would form a convenient unit and such a unit was recommended for adoption in the final report of the last Settlement. The recommendation has been accepted by Government and will be considered when the next Settlement operation commences.

37. Variation in Number.—There were 3,955 villages in 1911, of which 30 became uninhabited during the last decade, while 31 new villages came into existence in their places. The number of inhabited villages thus rose from 3,955 to 3,956. For the formation of 8 of the new Municipal towns and 19 Census towns, 59 villages were taken, and, 3,897 villages remained as such at the end of the decade. The number of the pakuthies has increased from 427 in 1911 to 435 in the present census, excluding the three Hill Pakuthies specially constituted for census purposes. How there could have been any variation in the number of the karas if their

boundaries, though not defined, are well known locally, is not clear. It may be that, in some pakuthies, portions undefined or uninhabited and situated beyond the limits of the locally known karas, which have become inhabited in course of time, are given special names, and added to the number of the karas in the pakuthies, as was done this time for census purposes in the case of 23 special Hill Karas. The average area of a pakuthy is 17.5 square miles while that of a kara is 1.93 square miles. The average distance between two karas remains the same as in the last census, *viz.*, 1.49 miles. A kara and a pakuthy have, on an average, a population of 924 and 9,188, respectively.

38. Variation in Population.—The variation in population is most marked in the towns and villages of 2,000 to 5,000 inhabitants. The villages of 500 inhabitants and below, have decreased in number as well as in population, by 10.5 and 7.9 per cent. respectively. Though the villages and towns of 500 to 1,000 inhabitants have increased in number by 2.3 per cent, they have fallen in population by 0.1 per cent. There is an increase in the number as well as in the population of the villages and towns of 1,000 to 2,000 inhabitants, to the extent of 7.6 and 7.7 per cent, respectively, while those of 2,000 to 5,000 inhabitants have increased in number by 30.1 per cent. and in population by 33.5 per cent. The highest increase both in number and population is observed in the villages and towns of between 5,000 and 10,000 inhabitants, the increase in number being 77.3 per cent. while that in population, 96.1 per cent. The villages and towns of between 10,000 and 20,000 inhabitants have gone up in number by 50 per cent., and in population by 38.4 per cent. while those of 20,000 to 50,000 inhabitants have increased by 50 per cent. in number and by 61.1 per cent. in population. The number of towns of over 50,000 inhabitants remains the same as in 1911, *viz.*, one, but the population has grown by 12.7 per cent.

39. Development of Towns.—In an ordinary village organisation, as in the case of this State, the population consists chiefly of land holders, cultivators and artisans; and in such an organisation, there is no possibility of the intrusion of outsiders, for there is no room for them; nor is there in such a village any room for shops, hotels, etc. In the caste system of the Malayalee tribe, there is no trader class, though there are in it the priestly class, the Malayala Brahmins, the warrior class, the Malayala Kshatriyas, and so on; and the absence of a place for the trader class must be attributed to the want of necessity for such an occupation, on the general principle that function precedes organisation. Even today, big merchants and traders are not Malayalees. They have taken to trade only lately, and that, on a very limited scale. When changes in the village economics are brought about by changes in the habits of life of the people, and, when the institution of public offices, schools, etc., necessitates the introduction or formation of such class of people as traders, agents, clerks, etc., the village develops into a town; and if, in such a town, the system of administration becomes complicated by the immigration of a large number of outsiders, and the people become sufficiently advanced to take charge of the administration, it further develops into a Municipality.

40. Towns-Cantonment and City.—In the Reports and Tables of previous censuses, Trivandrum is shown as a Municipal town and Cantonment. It is seen that there has been no Cantonment in the correct sense of the term in Trivandrum but that the mere existence of military lines in the town had been taken to constitute it a Cantonment; and it was recorded incorrectly as such in previous Census Reports. There are no towns in the State with a population of 100,000 and over, to be treated as Cities.

41. Number of Towns and Arrangements made for Census therein.—The number of the Municipal towns has increased from seven in the last Census to 19 in the present one; and 19 other places, declared towns under the Police Regulation and which are provided with sanitary staffs, have been treated as towns

for Census purposes and separate statistics collected for them. During the decade, there was neither plague nor any other epidemic disease to disturb the population of these towns, and the figures given represent the normal distribution. In the case of the Municipal towns, wards into which they have been divided for administrative purposes, were taken as Census units and the Presidents of the Municipal Councils were appointed Charge Superintendents. For the Census towns, karas falling within them were taken as units and the Officers in charge of the sanitation of the places were made Charge Superintendents.

42. Statistics for Urban and Rural areas.—Out of the total population

DIAGRAM 8. PROPORTION PERCENT OF RURAL AND URBAN POPULATION TO TOTAL POPULATION AT EACH CENSUS 1881 TO 1921.

of 4,006,062 in the State, 404,654 persons live in towns and the rest in rural areas. The percentage of urban population has increased from 6 in the last Census to 10.1 in the present one. This is due to the increase in the number of the towns from 11 to 38. In the diagram given in the margin, the relative proportion of the urban and rural populations is shown for the last 5 censuses.

43. Sex and Religion of the Urban population.—For every 1,000 males there are 947 females in this Census against 942 in the last. On the total population, the percentages of Hindus, Musalmans and Christians that live in towns are 10.5, 17.5 and 7.6, respectively.

44. Variation of population in Towns.—Making the adjustments required for change of limits, the percentage of increase observed in the population of the 11 towns that were censused both in 1911 and 1921, is 17·8, while it was 9·6 in 1911 and 17·8 in 1901.

45. Density—Houses and House Room.—The area of the Census towns has not been taken separately as it is included in the rural area in which they are situated. The total area of the 19 Municipal towns amounts to 109 square miles and their population 249,741, which gives a rate of 2,291 persons per square mile or 4 persons per acre. The number of occupied houses in the 11 towns which were censused last time also has increased by 13·6 per cent, while their population has gone up by 17·9 per cent. The total number of occupied houses in all the towns is 72,011 and the average number of persons for a house is 5·6 against 5·5 in the last Census.

46. Towns in the Natural and Administrative Divisions.—From the

DIVISIONS.	No. OF TOWNS.	POPULATION OF TOWNS.	No. OF PERSONS PER HOUSE.	No. OF FEMALES PER 1,000 MALES.	No. OF HINDUS MUSALMANS AND CHRISTIANS IN A POPULATION OF 1,000.			No. OF FEMALES OUT OF 1,000 MALES OF EACH RELIGION.		
					Hindu.	Musalman.	Christian.	Hindu.	Musalman.	Christian.
Sea-Coast	21	266,681	5·6	953	684	126	188	962	917	952
Inland	8	90,664	5·9	916	684	69	368	940	833	897
Mountainous	9	47,309	4·8	972	726	156	118	991	957	885
Southern	17	179,577	5·6	973	743	100	157	976	932	968
Central	12	140,198	5·6	943	618	157	224	965	923	898
Northern	9	84,179	8·9	898	563	88	347	915	855	889

table given in the margin, it will be seen that the largest proportion of females is found in the Mountainous Natural division and the Southern administrative

Division, while the smallest proportion is shown in the Inland Natural Division and the Northern Administrative Division. The Hindus preponderate in the Mountainous Natural Division and the Southern Administrative Division though, in the latter, they have fallen from 780 in the last Census to 743 at present. The largest proportion of Musalmans is found in the Mountainous Natural Division and the Central Administrative Division while the smallest is in the Inland Natural Division and the Northern Administrative Division. They have gained ground in the Southern and the Northern Administrative Divisions, where their proportions have increased from 85 and 84 in 1911 to 100 and 88, respectively, at present, but have lost ground in the Central Administrative Division where their ratio has decreased from 177 to 157. The Inland Natural Division and the Northern Administrative Division return the highest ratio of the Christians, but in the Central Administrative Division, their proportion has gone down from 231 in the last Census to 224 this time. They show an increase in the Southern and the Northern Administrative Divisions from 134 and 343 in 1911 to 157 and 347, respectively, at present. The highest proportion of the Hindu and the Musalman ladies is returned in the Mountainous Natural and the Southern Administrative Divisions, while that of the Christian ladies, in the Sea-Coast and the Southern Divisions. The largest number of persons per house, *viz.*, 5·9, is found in the Inland Natural Division and the Northern Administrative Division, and the smallest number, *viz.*, 4·7, in the Mountainous Natural Division.

47. Variation in the Major Municipal Towns.—As most of the towns were censused for the first time only on this occasion, they do not admit of comparisons being made with those of the previous Censuses. The following 5 major towns alone are therefore taken for comparison. The changes made in the limits of these towns during the decade and the inclusion therein of the houses on the outer side of the roads forming the boundaries of some of them account partly for the increase

in their population. The particulars of these five towns are shown in the subjoined table.

MAJOR MUNICIPAL TOWNS.	POPULATION PERCENTAGE OF INCREASE FROM 1911.	OCCUPIED HOUSES PERCENTAGE OF INCREASE FROM 1911.	AVERAGE NO. OF PERSONS IN A HOUSE.	AVERAGE NO. OF FEMALES PER 1,000 MALES.	NUMBER OF PERSONS IN EACH MAIN RELIGION PER 1,000 LIVING.			NUMBER OF FEMALES IN EACH MAIN RELIGION PER 1,000 MALES OF THAT RELIGION.		
					Hindus.	Musal-mans.	Chris-tians.	Hindus.	Musal-mans.	Chris-tians.
Trivandrum	14.5	13.5	6.1	949	794	75	131	949	861	1003
Nagercoil	15.1	13.5	4.9	1025	746	95	159	1008	1054	1087
Alleppey	24.9	13.1	5.6	898	462	264	272	890	948	865
Quilon	33.4	31.3	6.1	924	522	190	287	935	880	934
Kottayam	24.4	18.4	6.0	921	480	46	473	910	743	931

48. Trivandrum.—Trivandrum is the Capital of the State, and its present population is 72,784. It takes the fourth place among the big towns of the Madras Presidency and ranks next to Calicut. In 1911, the increase in the town was 9.8 per cent., against 20 per cent. in the rural area of the taluk in which it is situated. In this census, the increase in the town is 14.5 per cent. while that in the taluk is 12.1. An increase more than that found in the taluk must be expected in the town, where the number of public institutions has been increasing day by day and where there have been no epidemics causing abnormal reduction in the population. But, as Trivandrum is neither a commercial nor an industrial centre like Quilon or Alleppey, and as public institutions cannot draw as many persons as commerce or industry could do, the increase cannot be very large. The density of population in the town is 11 persons per acre, against the average of 4 in the rural areas. The highest density, 58 per acre, is found in the Manacaud A ward, and the lowest, 5 per acre, in the Pettah D Ward. The average number of persons per house is 6.1, while that for the rural area is 5.5. Of all the towns in the State, the highest average, 6.1, obtains in this town and in Quilon. The number of persons per house is highest in the Puthenchanthai A Ward where 8 persons live in a house and lowest in the Fort C Ward where the number is 4 per house. The increase in the number of occupied houses, *viz.*, 13.5 per cent. keeps pace with that in the population, *viz.*, 14.5 per cent. The Hindus form the majority and number 794, out of every 1,000 inhabitants against 663 in the rural area. For every 1,000 males, 949 females or 7 more than the proportional number for the rural area live in the town. The proportion of the Hindu ladies living in the town is more than the average in the urban area of the State. The Christian ladies outnumber the gentlemen by 3. 12,481 immigrants from other parts of Travancore and 4,397 from other Provinces and States were enumerated in the town.

49. Nagercoil.—Nagercoil comes next to Trivandrum in point of population. The number of inhabitants has risen from 29,883 in 1911 to 34,406 in 1921, *i. e.*, by 15.1 per cent while the percentage of increase was 15.9 in 1911. The increase is contributed mainly by the natural growth of the population and by immigration from outside. It is the centre of the activities of the Salvation Army. In the rural parts of the taluk in which the town is situated the population shows an increase of 11.8 per cent. while it was 10.7 in the last Census. The variations are too trifling to demand any explanation. The density of population is 18 per acre on an average; and it is highest in the Kottar Ward, being 38 per acre. and lowest in the Vadasseri Ward, 10 per acre. The average number of persons per house is 4.9. The number of females per 1,000 males is 1,025. This higher proportion of females to males is a peculiarity which the town shares with the taluk of Agastiswaram in which it is situated and with the adjoining taluk of Thovalai. The increase in the proportion of females is observed alike in the Hindus, the Musalmans and the Christians.

The Hindus form three-fourths of the population. The immigrants to the town from places within and outside Travancore number 4,046 and 1,589, respectively.

50. Alleppey.—This is the most commercial and industrial centre in the State. Although, in view of the development of industries and commerce which characterised the last decade, a marked increase must be expected in this town, the increase of 24·9 per cent. now observed may at first sight appear abnormal. The small increase of 3·1 per cent. reported in the town in the last census, while the growth in the population of the taluk in which the town is situated was 6·6 per cent. must be attributed, in the absence of any severe epidemics, to under-enumeration to which the census operations followed in 1911 lent itself. Though Alleppey is a Municipal town administered by a Council with a President over it, the Census operations of 1911 were conducted by the Tahsildar of the taluk along with those of the rural areas. Notwithstanding the fact that the town was divided into wards for all local administration, the units taken for Census purposes were, as in the rural areas, the undefined karas. As portions of some karas lie within the town and portions outside, in taking karas as units, the chances of leaving them out entirely are great, resulting in under-enumeration. If the decrease due to this is made up, the increase now observed will go down and the abnormality disappear. As the growth is chiefly contributed by immigrants resorting to the place for temporary labour, the increase in the number of houses, *viz.*, 13·1 per cent., does not follow closely that in population. The average number of persons per house has therefore risen from 4·9 in the last Census to 5·6 at present. The density of population is 11 persons per acre. The highest density, 32 per acre, is found in the Market Ward and the lowest, 6 per acre, in the Palace Ward. As many as 898 females for every 1,000 males live in the town and each religion is fairly represented—462 Hindus, 264 Musalmans and 272 Christians, in every 1,000 inhabitants. The largest proportion of the Musalmans is found in this town and their ladies number 948 for every 1,000 gentlemen. 5,675 immigrants from places inside the State and 1,294 from outside were enumerated in the town.

51. Quilon.—The rate of increase is highest in this town, being 33·4 per cent. while, in the rural parts of the taluk in which the town is situated it is 18·2. The President of the Municipal Council, when asked about the large increase in the population of the town, has reported that it is due to the existence in the town of a number of tile factories and other industries. The fact that the rate of increase in the number of occupied houses, the enumeration and numbering of which were attended to by the Municipal staff, has not fallen behind the rate of increase of people whose enumeration was done by school-master-enumerators, supports the argument of the President. But it does not completely account for so large an increase, which must be due, as stated in the case of Alleppey, to under enumeration in the last census. Next to Nagercoil and Trivandrum, the proportion of females to 1,000 males is highest in this town. The Hindus form the majority of the population and the proportion of their ladies is larger than that of any other religionist. The average number of persons per house is 6·1, as in Trivandrum. The number of persons per acre is 9·2. The density is highest in the Andamukkam Ward, 33 per acre, and lowest in the Cantonment Ward, 4 per acre. 3,169 immigrants from places within Travancore and 1,721 from outside were enumerated in this town.

52. Kottayam.—Kottayam is the last of the Major municipal towns in the State. It is the head quarter town of the Northern Division. The limits of no other town in the State have been so often changed as those of this town. There was an increase of only 2 per cent., after making adjustments for the changes of boundaries, in the last Census, while, in the taluk in which it is situated, the increase was 20·7 per cent. The public health of the town was reported to be satisfactory. It has been the centre of stores for the supply of food, and a depot for the recruitment of labour, to the numerous estates in Mundakayam, Peermade and Periyar and a place of discharge of cargo coming from those estates. That, under these circumstances, the increase in the town should be less than that found in the taluk is hardly

believable, and must be due to under-enumeration in 1911 as was the case in the towns of Alleppey and Quilon. In this Census, the population has increased by 24·4 per cent. while in the taluk the rise is 19·7 per cent. Between the town and the taluk, there is not this time such wide disparity in the increase as there was in 1911. The present increased rate in the town is evidently due to the commercial and industrial activities and the supply of omissions made in the last Census. Of all the major municipal towns, Kottayam has the largest proportion of the Christians, *viz.*, 47 per cent. and the smallest ratio of the Musalmans *viz.*, 4·6 per cent. The number of occupied houses has increased by 18·4 per cent. The average number of persons per house is 6. The density of population is 6·6 per acre, which is the lowest average among the major municipal towns. In this Census, 1,823 immigrants from inside Travancore and 442 from outside were enumerated in the town.

NOTE.—The figures in Antique indicate the variation on the basis of 1911 area.
The high proportions shown in column 10 are due to the increase in the number of towns separately censused this time.

CHAPTER III.

BIRTH-PLACE.

53. Opening Remarks.—The subject matter of this chapter is important in more than one respect. In the first place, the information contained is useful in determining the natural increase of population. Secondly, from the volume of migration, the stages of human society through which the people are passing can be ascertained. For example, there will be very little or no migration in the agricultural stage, while, in the commercial and industrial stages, it will be extensive. Thirdly, the figures collected may be made use of in gauging the amount and the nature of the economic and industrial progress of the country. Lastly, the supposed influence of caste, religion or race on migration can be sifted and brought out in its true proportion. The use of birth-place figures, in the first two aspects, has been noticed in Chapter I ; and their utility as measurers of economic progress, industrial advancement, etc., will be shown in the present and subsequent chapters.

54. Causes of Migration.—In the Census Report of India for 1901, it is stated that migration from India, is of exceedingly small amount, that the natives of the country are intensely home loving and that caste restrictions stand in the way of migration among Hindus. As an additional cause for the small volume of migration is given in the Travancore Census Report of 1911, the absence of "need". How far these causes are in operation at present in Travancore will be noticed when each type of migration is dealt with.

55. Reference to Statistics.—The following Imperial and Subsidiary Tables supply figures for the discussion of this Chapter.

Imperial Table XI. Birth-place.

Subsidiary Table I. Immigration (actual figures).

II. Emigration (actual figures).

III. Proportional Migration to and from each Division.

IV. Migration between Travancore and other parts of India.

56. Immigrants from outside the State.—The total number of persons born in places outside Travancore and enumerated in the State in 1921 was 73,591, forming about 1·8 per cent of the entire population, against 61,165 and 1·7 in 1911. Deducting from 61,165, the number that must have died at the rate obtaining in the State, *viz.*, 20 per mille per annum, the survivors at the time of the present Census will be 48,932. So, the fresh immigrants during the decade comes to 24,659. Of the total 73,591, the number born in the Contiguous British districts is 37,577, in the Cochin State, 12,366 and in other parts of the province of Madras, 20,700. The remaining 2,948 persons are contributed by the British provinces (792), the French Settlements (42), the Portuguese Settlements (18), the Indian States and Agencies (477), Countries in Asia outside India (1,241), Europe (367), Africa (6), America (4) and Australasia (1).

57. Emigrants from the State.—From the figures supplied by the Provincial Superintendents and given in the margin it is observed that 22,251 Travancoreans were enumerated outside the State in India. Of this number, 9,492

were enumerated in the British Provinces and 12,759 in the Indian States and Agencies. In the last Census it was found that 26,218 persons born in Travancore had been enumerated outside this State, in India. As some of them must have died in the decade and calculating their number at the rate of 30 per mille per year, the death rate in India outside Travancore, particularly in the decade under review when there were Influenza and Plague, the survivors from the previous decade would be 18,353. Subtracting this from the number enumerated in this Census, the number of fresh emigrants during the last decade amounts to 3,898. As it was not found possible to get complete information from the returns received about all the emigrants from a country, additional columns

were opened in the Enumeration Schedule of this State, as stated in the Introduction, to note the number, age, sex and place of destination of such persons as had left Travancore for countries outside the State during the decade. From the figures so collected and given in the third column of the table in the margin it is seen that, 4,161 had left for provinces and States within India and 5,181 for places outside India. The difference between the number of survivors from the last Census, as calculated, and the number returned in the Schedule of the State as having left the State for places in India, comes to 263 only. This small difference can easily be accounted for by the assumption that some of the emigrants who had left this State, at first for places within India might have subsequently left them for places outside. This inference is supported by the fact that though, according to the return received from the Census Commissioner for India, the number of Travancoreans enumerated in the Federated and Unfederated Malay States, Singapore, Penang, etc., was 8,009, the number that had left the State for those places according to the figures entered in the additional columns of the schedule in the State is only 4,525. The excess over the figures collected in the State, viz., 3,484, must be contributed either by persons who had originally left the State for places within India but who had subsequently gone to places outside, or by

* As the returns for Burma, Central Provinces and Ceylon were received only after the preparation of the subsidiary tables, the figures of those places were not included in the tables.

the survivors of those who had gone there in the previous Censuses, for whom, however, no figures were forthcoming in the last Census.

58. Types of Migration—Casual type.—Migration is of various kinds, viz., casual, temporary, periodical, semi-permanent and permanent. The casual type is not of any importance. Without in any way being affected by the movement of the people, it shows increase in volume, when smaller units are taken for tabulation. Of the total population of 4,006,062 enumerated in this Census, 3,932,471 were born within the State, giving a rate of 9,816 for every 10,000 enumerated, against 9,822 in 1911. The proportion of the home-born on the total number of persons enumerated in the whole of India in 1911 was 9,924, while it was 9,939 in Madras and 9,646 in England and Wales. Travancore, in this respect, is approaching England and Wales and receding from India and Madras. The great majority of the persons that migrate from one taluk to another are of the casual type. Almost all classes of people are comprised in this type and the causes of the migration though various are not of much importance.

59. The temporary and periodical types.—These two types may be combined and treated together for the reason that migration may be temporary and periodical at the same time. The combined type corresponds to the "Visitors" type dealt with in the Census Reports of England and Wales. The few pilgrims that visit the shrines at Kaniakumari (the Cape,) Ananthasayanam (Trivandrum) and Janardanam (Warkalai) and who do not restrict their pilgrimages to any specified period represent the temporary type of immigration. They are composed chiefly of Gosayies from Northern India and persons from outside Travancore. It is not possible to give even an approximate estimate of their numbers. The "need" in this case is religion. The seasonal or periodic type of immigrants consists of coolies who resort to the paddy fields in the *Kayal* reclaimed and *Cherical* areas during harvest time, and of well-to-do persons who visit Alwaye, Cape and other places for health during summer. The immigrants in the first case are drawn chiefly from within the State, while, in the other, they come from outside, chiefly Cochin. The excess of 842 persons found at the time of the final Census in the population of Alwaye, over the number in the preliminary enumeration, is composed mostly of visitors for health. Unlike the Europeans and Americans, there are few in this State who can afford to visit one country after another for health and sightseeing.

60. Semi permanent type.—This is an important type consisting chiefly of coolies who work in the rubber and tea estates of the State and abroad. The number of such persons who have emigrated to Ceylon, Singapore, Penang and other Federated and unFederated Malay States during the last decade, as collected from the Enumeration Schedule of the State, is 4,525, of whom many are Hindus. The cooly immigrants enumerated in the High Range Division also belong to this category. The need in their case is not always food-hunger. Other classes of persons composing this type are officers, professional men, traders and businessmen. The 389 Europeans and allied races enumerated in the State belong to this type. The need in the case of a large number of these people for migration is not food-hunger but gold-hunger. As, for higher ranks of service abroad, officers are not recruited from India, the chances of Indians going out as officers are few. There are not many persons here with sufficient capital, education and training befitting them to take to commercial and industrial enterprises; but signs are not wanting to indicate that a definite move has been made in this direction by a few, though their activities are at present confined chiefly to the State. If facilities are given, even for slightly higher remunerations than those obtaining in India, persons are prepared to go abroad without allowing religion, caste or race to stand in their way, is evident from the number of persons who have gone from this State to Mesopotamia. It is seen that, during the decade under review, 395 persons many of whom are Hindus including Brahmins, have left Travancore to that distant country for service in Civil and Military Departments, and it is a note worthy fact that 4 of them are women. The last class

under this type consists of students proceeding to Europe and America for higher education. 36 persons including one female have left the State during the decade for those Western Countries.

61. Permanent type.—It is not possible to form from the census figures an estimate of the number of outsiders who have permanently settled down in the State during the last decade.

62. Migration into and from Natural Divisions.—The statement given in the margin shows the proportion which the home-born and the immigrants from the adjoining Natural Divisions and outside the State bear to the total population in each Natural Division. The percentage of the home-born is highest and of immigrants from outside lowest, in the Inland Division. As stated in Chapter I,

STATEMENT SHOWING THE PERCENTAGE OF HOME-BORN AND IMMIGRANTS FROM OTHER DIVISIONS AND OUTSIDE THE STATE TO THE TOTAL POPULATION IN EACH NATURAL DIVISION.

NAME OF NATURAL DIVISION.	HOME BORN.	IMMIGRANTS FROM.			
		NATURAL DIVISIONS.		OUTSIDE.	
Sea-coast	95·8	Inland 2·7	Mountainous 0·5		1·0
Inland	97·1	Sea-coast 1·6	Do. 0·7		0·5
Mountainous	88·4	Do. 3·2	Inland 3·1		5·3

there are no large scale industries in the Division to attract persons from outside. The smaller percentage of the home-born in the Sea-Coast Division is attributable to the reasons given in para 16 *supra*. In the Mountainous Division, where, on account of the cultivation of rubber and tea,

coolies from outside are recruited for work, the home-born proportion is found to be lowest and that of immigrants from outside highest.

1. No figures are available for emigrants from each Division. Hence, columns 11-16 for the Divisions are left blank.
2. As the return of persons born in the State and enumerated in Ceylon was received only after the preparation of this table, the figures for them are not included in columns 11 to 13.

CHAPTER IV.

RELIGION.

63. Reference to Statistics.—

Imperial Table V. Towns arranged territorially with population by Religion.

- VI. Religion.
- XV. Territorial distribution of the Christian population by Sect and Race.
- XVI. European and Allied Races and Anglo-Indians by Race and Age.

- Subsidiary Table I. General distribution of the population by Religion.
- II. Distribution by Divisions of the Main Religions.
 - III. Christians—Number and Variation.
 - IV. Religions of Urban and Rural Population.

64. Scope of the Chapter and Nature of the Return.—It is not proposed to discuss in this chapter the philosophy, doctrine or ceremonies connected with the several religions, as they have been described more or less fully in previous censuses; but, the numbers returned and their variations will be considered now. The instructions issued to the enumerators were the same as in the last census. They were required to note the main religion each person professes, and, in the case of the Christians, to ascertain and note their sect also. For the information of the enumerators, a list of the main sects that are common among the Christians here, was printed and supplied to them. Whatever may be the difference in the religious beliefs of the several classes of people and however difficult it may be to define them, neither the adherents of the several religions nor the enumerators had any difficulty in returning the correct religions. The statistics collected can, therefore, be taken as accurate, except those for the Animists, which, for reasons that will be given when dealing with them, cannot be considered as quite correct.

65. Distribution of the Population by Religion.—The entire population of the State is returned under 8 religions. The names of those religions, with the population under each, are given in the marginal statement. It will be seen therefrom that, of the eight religions mentioned, the last four, viz., Jews, Jains, Buddhists and Zoroastrians together return only 349 persons, or about 0.00008 per cent. of the entire population.

DIAGRAM 9—SHOWING THE PROPORTION (PER CENT) WHICH THE SEVERAL RELIGIONISTS BEAR TO THE TOTAL POPULATION.

RELIGION.	POPULATION.	Per 1,000.
Hindu .	2,549,664	640
Musalman .	270,478	68
Christian .	1,172,934	293
Animist .	12,637	3
Jew .	274	..
Jain .	33	..
Buddhist .	36	..
Zoroastrian .	6	..

In every 1,000 persons of all religions, the Hindus number 640, the Musalmans 68, the Christians 293 and the Animists 3. The Hindus form the majority and constitute two-thirds of the population, while the Christians represent a little more than one-fourth and the Musalmans, about one-fifteenth, of the population enumerated. In the diagram given in the margin, are shown the proportions which the three main religions individually and the others grouped together, bear

to the entire population.

66. Variations in the Decade and Relative Growth of the different Religions.—

DIAGRAM 10—SHOWING THE RELATIVE GROWTH OF THE 3 MAIN RELIGIONS FROM 1891 TO 1921.

In the decade under review, while the Hindus, the Musalmans and the Christians have increased by 11·7, 19·4 and 29·8 per cent., respectively, the Animists have decreased by 19·9 per cent. If the Animists are included among the Hindus, the percentage of increase for the latter would come to only 11·5. From 1881 to 1921, the Hindus have risen by 45·9 per cent., the Musalmans, by 84·1 per cent. and the Christians, by 135·3 per cent. In a 10,000 of all religions, the Hindus have fallen from 7,312 in 1881, to 6,396 in 1921 or by 924, while the Christians and the Musalmans have risen from 2,078 and 612 to 2,928 and 675 or by 850 and 63, respectively. The relative growth of these religions, taking that each of them had started at 1,000 in 1881, is graphically represented in the marginal diagram.

67. Hinduism—Hindus, their Number and Variation.—Hinduism is the prevailing religion of the State. Though it is not easy to give a comprehensive definition of this religion, so as to bring under it the different tenets, beliefs and creeds that are covered by the term, neither the enumerators nor the enumerated had any difficulty in the matter of its return. The attitude of the orthodox Hindus towards the untouchables and those that lie on the border land of Hinduism was generally friendly. The Hindus form the majority and contribute 64 per cent to the total population. They have increased by 11·7 per cent. from the last Census and including the Animists by 11·5 per cent. If, to the present strength of these religionists, the number of the Hindus and the Animists who have become Christians during the decade, which, with their natural increase, might be roughly taken as 50,000, be added, the rate of increase for 1921 will come to 13·3 per cent. Though the Hindus numbered 6,895 in every 10,000 of the total population in 1901, they fell to 6,657 in 1911, and to 6,365 in 1921. The fall has been gradual and steady. The increase of 11·7 per cent. found among the Hindus in this Census is lower than their rise in the last Census by 0·4 and than that in the general population by 5·1. In the absence of unusual mortality and emigration among them, this low rate of increase must be attributed to a fall in their birth-rate. As, among females, the ages between 15 and 19 when about 49 per cent of the children are born, are, considered to be most fertile, a high birth rate de-

pends chiefly upon the number of married women of younger ages. A comparison of the figures for 1911 and 1921 shows that, among the Hindus, the number of married females in the age-groups 10 to 14 and 15 to 19 has fallen from 59 and 517 for 1000 females of each age group in 1911 to 47 and 437, respectively, in 1921. This is due, among other causes, to the operation of the Nair Regulation passed at the commencement of the decade and the advance of education among females in general which have the effect of postponing marriages to later ages and of limiting their number. As will be shown in para 172 the natural increase of population among the Nairs in the decade under review is less than 10 per cent.

68. Local Distribution.—More than 50 per cent. of the total Hindus of the State were enumerated in the Sea-Coast Natural Division. They form 77 per cent. of the population of the Division, and, with Animists, number 7,083 for every 10,000 inhabitants, against 7,300 in 1911, 7,457 in 1901 and 7,783 in 1891. In the Inland Division, about 29 per cent. of the total Hindus of the State were returned, who form about 58 per cent. of the population of the Division. For every 10,000 inhabitants, the Hindus, with the Animists, count in this Division 5,842, as against 6,171 in 1911, 6,663 in 1901 and 6,928 in 1891. About 21 per cent. of the total Hindus of the State live in the Mountainous Division; and they form 57 per cent. of the population of the Division. Their proportion, including that of the Animists, for every 10,000 inhabitants, has been decreasing in this Division from 6,871 in 1891 to 6,484, in 1901, 6,218 in 1911 and 5,804 in 1921. If the Administrative Divisions are taken, it will be seen that the Hindus form the majority in all the Divisions, the High Range Division having the greatest proportion, *viz.*, 76 per cent and the Southern, Central and Northern Divisions following in order, with 70, 69 and 52 per cent., respectively. From 1891 to 1921, their number, with that of the Animists, for every 10,000 inhabitants has been decreasing in all the Divisions. The Malayalees, who form 82 per cent. of the total Hindus of the State, contribute 79 per cent. to the Hindu population of the Sea-Coast, 94 per cent. to that of the Inland, and 87 per cent. to that of the Mountainous Natural Divisions. Taking the Administrative Divisions, the Malayalees form 94 per cent. of the Hindus in each of the Central and Northern Divisions, and 6 and 12 per cent. of those in the Southern and High Range Divisions, respectively. The non-Malayalees, who constitute 18 per cent. of the total Hindus of the State, contribute 88 per cent. to the Hindu population of the High Range Division and 78 per cent. to that of the Mountainous Division.

69. Animism.—It is maintained by the eminent writers of the present generation that, of the three great world systems of thought, *viz.*, the Animistic (Mythological), the Religious and the Scientific, the Animistic occupies the first stage, the Religious and the Scientific following in order. Animism, in itself, is not a religion, but, it contains the prerequisites from which religions are formed. Animism, the first conception of the world which man succeeded in evolving, is therefore psychological.

The Animists were separately censused for the first time in 1901, when they numbered 28,183. In 1911, they became half extinct and numbered only 15,773. In this Census, they have fallen to 12,637. In the absence of clear conception as to what Animism is and who the Animists are, the instructions given to the enumerators were as follows:—"In the case of the dwellers in forests and others who do not return themselves as either Christian, Hindu or Mahammadan or under any other religion, enter the name of the social group by which they are generally known, such as Velan, Mannan, Vedan, Etc. If the person is a forest dweller, enter the name of the tribe or social group by which he is known." As a matter of fact, the enumerators returned such of the hill-men as were found in the plains, at the time of enumeration, as Hindus, and those in the hills, by their tribal name. As, under the present conditions, the hill men visit the plains oftener than before, the chances of their having been returned as Hindus are more. This partly accounts for the fall in their number. The few that were returned in the Sea-Coast Division were actually those enumerated in the hilly tracts of

the Coast taluks of Neyyattinkara and Vilavancode. As the number of the Animists is very small and as it is liable to variation, in discussing their local distribution, they are included under the Hindus.

70. Muhammadanism—Musalmans, their number and variation.—The Musalmans have increased in this Census by 19·4 per cent. while their increase in 1911 was 18·91. They form about 6·8 per cent. of the population of the State.

71. Local Distribution.—In the Sea-Coast Division, 53 per cent. of the total number of the Musalmans in the State were enumerated, and their proportion for every 10,000 inhabitants has been increasing in this Division from 752 in 1891 to 770 in 1901, 781 in 1911 and 800 in 1921. In the Inland Division, only 22 per cent. of their total number live, and their proportion for every 10,000 persons had been decreasing from 542 in 1891 to 492 in 1901 and 470 in 1911; but a slight increase *viz.*, 478, is observed in 1921. Twenty-five per cent. of the total number of the Musalmans in the State were enumerated in the Mountainous Division, where their proportion for every 10,000 persons has been increasing from 449 in 1891 to 603 in 1901, 692 in 1911 and 697 in 1921. Coming to the Administrative Divisions, they maintain their high proportion in the Central Division, *viz.*, 748 for every 10,000 inhabitants to which they have risen gradually from 682 in 1891, 715 in 1901 and 724 in 1911. The Southern and the Northern Divisions follow, beginning with 608 in 1891 and gradually rising to 683 in 1921 in the former and with 565 and 602 in the latter. In the High Range Division, they have lost ground, and have fallen from 377 in 1891 to 293 in 1921.

72. Christianity—Christians.—Christianity is the religion of about 30 per cent. of the population of the State. The number of the Christians in Travancore bears a proportion of 25 per cent., to the total Christian population of India. It is believed that one of the Apostles introduced Christianity in Travancore in the remote past. The original Christians are called Nazrani Mappillas or Syrian Christians. Though proselytism is carried on by them in common with others, the converts are not called Nazrani Mappillas. In other words, the Mappillas are, as it were, born and not made. Whatever may be the truth of the report, it is seen that the Mappillas differ from other Indian Christians in their habits, mode of life, dress, etc., and they do not intermarry with them. Their mother tongue is Malayalam and they are mostly found in Travancore and Cochin. The word "Syrian" prefixed to "Christian" in the term "Syrian Christian" does not appear to indicate any special form of faith but seems to have a connotation similar to that of "Indian" in "Indian Christian" and denotes a separate social community.

There are several Christian missions working in the State and the chief among them are the London Mission Society, the Salvation Army, the Missouri Evangelical Lutheran Mission with headquarters at Nagercoil, the C. M. S., the Brethren Mission with head quarters at Kottayam and Thiruvella, the Church of England Zenana Mission the Diocese of Travancore and Cochin with head-quarters at Kottayam, the Diocese of Verapoly, Vicarite Apostolic of—Changanacherry, Eranakulam and Kottayam, the Saint Thomas Syrian See of Malabar, the Syrian Archdiocese of Malankara and the Syrian Knanaya Diocese of Malabar.

73. Number and Variation.—The total number of the Christians enumerated in this Census was 1,172,934 which gives an increase of 29·8 per cent. over the figure for the last Census. The rate of increase in 1911 was 29·6 per cent.

The several Christian Missions in the State were requested to supply information regarding the number of the Hindus and the Animists who had joined Christianity during the decade. All the Missions except two have furnished the information, and the total number of converts, according to their statements, comes to 37,528. If this number is increased by 16·8 per cent., which is the general rate of growth in this Census, the number of the converts and their children will amount to 43,833. Taking 6,000 roughly, as the number of persons converted by the

two Missions that have not supplied the information, and their natural increase the total number that has to be taken away from the Christian and added to that of the Hindu population, may be put down at 50,000. Deducting this number from the Christian population, the rate of increase among the Christians comes to 24·2 per cent.

74. Europeans.—The number of the Europeans and Allied Races including Armenians enumerated in the Census was 389 against 399 in 1911. The slight decrease may probably be due to the return of some of the Europeans to their homes after the War.

75. Anglo-Indians.—The number of the Anglo-Indians returned in this Census was 3,821, against 1,750 in the last Census which gives an increase of 118 per cent. This is certainly abnormal and cannot be the result of either natural increase or immigration. The increase is evidently due to the inclusion among them of English speaking Indian Christians who have adopted the European mode of dressing.

76. Indian Christians.—Syrian Christians.—Indian Christians may be divided broadly into Syrian Christians and other Indian Christians. Taking the Syrian Christians first, they number 617,049 in a total of 1,172,934 Christians, or about 53 per cent. Their classification, as given in the India Census Commissioner's list, is not considered by them to be satisfactory and complete. There is no place for Anglican Syrians in the classification. As Roman Catholics are divided into two classes, Syro-Romans and Romans, so, for "other Christians", there should be two classes, one to be specially used for Syrians and the other for others. "Reformed Syrians" is not thought to be a happy designation, as the expression is said to carry with it, by implication, an unpleasant reflection on them. Whether on this account or for other reasons, not a single Christian has returned himself under this denomination in this Census. The number of the Syrian Christians shows only an increase of 8 per cent. over that in the last Census; and if the converts to the Syrian Church, numbering 2,712, be taken away, the percentage falls lower still. While the Christians, as a whole, have increased by over 29 per cent. there is no reason why the increase among the Syrian Christians should fall below the average. That the fall in the rate of increase found among them is only apparent will be shown below.

77. Roman Catholics and Romo-Syrians.—The number returned under the Roman Catholics is 327,979, against 173,794 in 1911, while that under the Romo-Syrians is 283,333, against 293,407 in the previous Census. These two sects follow the same faith, and, in returning their denominations, no distinction is generally made between them. This accounts for the rise in the number of the Roman Catholics and the fall in that of the Romo-Syrians. If the figures for the Roman Catholics and the Romo-Syrians are added together, their number would stand at 611,312 against 467,201 in 1911, showing an increase of 30 per cent. which is not much above the average increase among the Christians, *viz.*, 29·8 per cent.

78. Syrian Jacobite.—23,347 persons have returned themselves merely as "Syrian" and they are included under "Syrian Jacobite" as, by "Syrian", without "Jacobite," is generally meant "Jacobite Syrian". It is not known whether any person had returned himself merely as "Syrian" in the last Census and, if so, under what denomination he had been included. The rate of increase among them is 11·8 per cent. against 11·0 in 1911.

79. Mar Thoma Syrians.—In the last Census, these Syrians were returned under "Reformed Syrians". This time, according to the instructions of the Head of the Mar Thoma Church, all adherents to that church have returned themselves as "Mar Thoma Syrians". They show an increase of 44 per cent. which is lower than the rate found in 1911, *viz.*, cent per cent.

80. Syrian Chaldaeans.—While there were 1,612 persons under this sect in 1911, none has returned himself under it this time. As these persons are Roman Catholics in belief, the chances are that they have returned themselves either as Roman Catholics or as Romo Syrians.

81. Other Indian Christians-Salvation Army.—The head-quarter of this Army is at Nagercoil and it has branches in Trivandrum, Quilon and other places. Its number has increased from 16,794 in 1911 to 33,824 at present. The increase amounting to more than cent. per cent. in its number is due to the activities of the Mission in the work of proselytism.

82. Yuyomayam Sect.—The birth place of this sect is Travancore and it was founded in 1875. The adherents of the sect were separately censused for the first time in 1901, when their number was 1,051. In 1911, its strength rose to 1,121 and in this Census, it has fallen to 998.

83. Local Distribution.—39·2 per cent. of the total Christian population, was enumerated in the Inland, 32·8 per cent. in the Sea-Coast and 28·0 per cent. in the Mountainous Division. Their number for every 10,000 of the total population has been increasing in all the Natural Divisions. Among the Administrative Divisions, the largest proportion is found in the Northern Division, *viz.*, 46·3 per cent. Then come in order the Central Division with 30·3 per cent, the Southern Division with 22·4 per cent, and the High Range Division, with 1·0 per cent. Their number for every 10,000 of the total population has been increasing from Census to Census, in all the Divisions. The largest percentage of the Syrian Christians is found in the Inland Natural Division, 54 per cent., and in the Northern Administrative Division, 60 per cent.

SUBSIDIARY TABLE I.—*General distribution of the population by Religion.*

RELIGION AND LOCALITY.	ACTUAL NUMBER IN 1921.	PROPORTION PER 10,000 OF POPULATION IN				VARIATION PER CENT (INCREASE + ; DECREASE -.)			NET VARIATION. 1891—1921

CHAPTER V.

AGE.

84. Introduction—It is stated that, even in Western countries, the entries of age are unreliable, owing partly to ignorance, partly to carelessness, and partly to deliberate misstatement which is very common among women, especially aged spinsters. Such being the case in educated Europe, to expect complete accuracy in the ages returned in India, where the majority of the people are illiterate, is something unattainable. But, the improvements made in the successive censuses in the method of enumeration, instructions to enumerators, etc., might be supposed to have contributed to the accuracy of the age returns also. As information about age is generally obtained by directly interrogating the persons enumerated or by making enquiries from others, or by guessing, the advancement of education among the people of the State and the appointment in this Census, as enumerators, of school masters who have frequently to ascertain the age of their pupils and who are thus in a position to guess the age more correctly than others, have increased the chances of obtaining more accurate figures than those of previous censuses. The unreliability of the age figures applies chiefly to individual ages; and, as the quinquennial grouping of the ages neutralises to a large extent the inaccuracies of single ages, the grouped figures taken for discussion can be regarded as sufficiently accurate for all practical purposes.

85. Reference to Statistics.—The statistics made use of in this chapter are contained in Imperial Tables VII, VIII, XII and XIV and in the Subsidiary Tables noted below.—

Subsidiary Table.

- I. Age distribution of 100,000 of each sex by annual age periods.
- II. Age distribution of 10,000 of each sex in the State and each Natural Division.
- III. Age distribution of 10,000 of each sex in the State and each Natural Division in each main religion.
- IV. Age distribution of 1,000 of each sex in certain castes.
- IV. A. Proportion of children under 12 and of persons over 40 to those aged 15-40 in certain castes and also of married females aged 15-40 per 100 females.
- V. Proportion of children under 10 and of persons over 50 to those aged 15-40 and also of married females aged 15-40 per 100 females.
- V. A. Proportion of children under 10 and of persons over 60 to those aged 15-40 in certain religions and also of married females aged 15-40 per 100 females.
- VI. Variation in population at certain age periods.
- VII. Reported birth rate by Sex and Natural Division.
- VIII. Reported death rate by Sex and Natural Division.

86. The Nature of the Age Return.—The instructions issued to the enumerators for filling in the age column were as follows:— “Enter the age as it will be” “on the 18th March, 1921. Note that the number of years which would be actually”

To face page 45.

Diagrams 11 to 14 showing the proportion per 100 which the males & females of each age period bear to their total population in each Religion.

Diagram 11.

Diagram 12.

Diagram 13.

Diagram 14.

"completed on the 18th is entered and not the current year of age." In the last Census, the instructions given were to record the number of years which each person had completed after birth. The addition made in this census, *viz.*, to enter the number of years that would be actually completed on the Census day, is certainly an improvement over the old instructions and would be effective more in the cases in which the Census schedules are given to the people for being filled in by them leisurely, than in others where enumerators get the information and fill the schedules themselves in the limited time at their disposal. Brahmins and such other castes as are particular of giving their girls in marriage before the age of puberty, are comparatively few in this State. Hence, the question of under-statement of the ages of unmarried girls hardly arises here. As there is not much of immigrant population in this State, no estimate need be made of the influence of immigration on the age returns. Some peculiarities of the Census figures will be noticed here. One of them which is observed in all censuses is with reference to the numbers returned under the ages 1, 2, 3, 4 and 5. Under normal conditions, the number of infants one year old and below should be the highest in the age group 0-5. After the first year, the figures for each successive year up to five should gradually decrease, and, in the fifth year, the number should be the lowest. Instead of this, with no abnormal conditions to cause variation, a progressive increase of numbers is found in the ages 1, 2 and 3, a decrease in number in the age 4, and, an increase again in the age 5. These variations must be due to the error in guessing the ages of children. Another peculiarity will be noticed

TABLE SHOWING THE NUMBER OF PERSONS RETURNED
IN CERTAIN AGE PERIODS IN THE LAST 3 CENSUSES.

1901.		1911.		1921.	
Age period.	Number.	Age period.	Number.	Age period.	Number.
0-5	389,607	0-5	465,811	10-15	511,280
		10-15	417,368		
		15-20	326,915	25-30	348,475
15-20	275,662	25-30	311,234		
20-25	122,274	30-35	122,978		

from the marginal table which shows that Census figures are not always dry and of grave import but that they are now and then amusing bordering on absurdity. Children under the age of 5 numbering 389,607 in 1901, in their perilous journey usually attended with casualties, to reach the age period 10-15, have, instead of losing any in their strength, actually increased by 27,761, when they were mustered and counted in 1911. That the persons between 15 and 25 have not fallen behind their youngsters in the manifestation of this mysterious phenomenon, is seen from the fact that they, on their onward march extending over 10 years, have made accession to their strength to the tune of 36,276 persons, when they reached the next decennial period. That the number of persons in each of the age periods 0-5 and 15-20 in 1911 shows increase in 1921, proves that this Census is not free from such surprises. The increase of the figures in the age period 0-5 may be attributed to the general inaccuracy on the part of the parents in giving the ages of children below 5 years. The increase of the figures in the age period 15-20, may be partly due to the difficulty in guessing the age of a person at a period when the growth is greatest, partly to intentional misstatements, as the ages under reference are all important in the matter of admission to public examinations and Government service and of determination of questions of majority and minority and partly to the general assumption on the part of the people that students are usually between those ages.

87. Age Periods by Religion & Sex.—In the diagrams given on the opposite page, are shown the proportions which the number of males and females of each age period bears to their total numbers, for all religions put together and for the three main religions, Hindu, Musalman and Christian. It will be seen therefrom that, while, for all religions and the Hindus, the proportion for children under 5, in both the sexes, is 6.6 and 6.5 per cent. respectively, for the Musalmans and the Christians, the corresponding ratios are 7 per cent. for males, and 6.9 per cent. for females. In the next age period 5-10, as compared with the ratios for all religions, the proportions for the

Hindus go down, and those for the Musalmans and the Christians rise up. The inference that could be drawn from this is either that the rate of mortality among children is lower among the Musalmans and the Christians than among the Hindus, or that the fecundity rate for the Hindus is lower than that for other religionists. The facts collected and discussed elsewhere seem to give support to the latter inference. In the age period 10-15, while, among males, the proportion for the Hindus is equal to that for all religions, among both the sexes, the ratio for all religions goes below that for the Christians and the Musalmans. In the next age period 15-20, so far as females are concerned, the Hindus show the highest proportion and the Musalmans, the lowest; and, as regards males, the Christians show the largest ratio and the Hindus the smallest. From the age period 15-20 to the very end, the Hindu females have the highest proportion, their ratio being even higher than that for all religions. Between the ages of 20 and 25, the period of collegiate education, the male proportion for the Hindus and the Christians is lower than that for the Musalmans. This may be due, among other causes, to the fact that the Hindus and the Christians resort more than the Musalmans to higher education which, by the strain it produces, causes in some cases even premature death. In the effective age period 25-45, the Hindu males have the highest proportion, and the Musalman and the Christian males follow in order. In the age period 45-60 also, the Hindu males maintain their high proportion while the Musalman and the Christian males exchange their places. In the ages 60 and above, the Musalmans show the highest ratio of males, and the Hindus that of females.

88. Variation in each quinquennial age period by Sex and Religion in the last three censuses.—The diagrams facing this page illustrate the variations in the number of persons of each sex in each quinquennial age period, in the last three censuses. It will be noticed from Subsidiary Tables II and III that while, in the censuses of 1901 and 1911, there was an increase in the proportion of boys and a decrease in that of girls, in the age group 5-10, as compared with the age period 0-5, in the present Census, there is rise not only in the ratio of boys but also in that of girls. An intercensal increase in the age periods 10-15 and 15-20 and a decrease in the age group 20-40, among both males and females, are found to be common to the last three censuses. Again, in the decade under review, as compared with the previous one, a rise in the proportion of men aged 60 and a fall in that of women of the same age are observed.

If the main religions of the State are taken, it is seen that, while, in the decade 1901-1911, there was an increase in the proportion of boys and girls among the Hindus and the Musalmans, under the age 5, a decrease is observed in their ratio in this decade. But, among the Christians, a growth in the proportion of boys and a decline in that of girls are found to be common to both the censuses of 1911 and 1921. The proportion of the Hindu children of both sexes, between the ages of 5 and 10, shows increase not only in the previous censuses but in this census also. Among the Musalmans and the Christians, however, although male children show a rise in this as well as in the previous censuses, female children show an increase only in the last two censuses and not in this census. The proportions of males and females in the age periods 10-15 and 15-20, have come up in this decade in all the religions. But, both in this and in the previous censuses, a decrease is found in the proportions of both males and females, in the age group 20-40. The ratio of males in the age group 40-60 has come down in all the religions, while that of females has gone up among the Christians and the Musalmans. The proportion of old men among the Christians and the Musalmans, and that of old women among the Christians have risen in this Census, while the ratio of old women among the Hindus and the Musalmans and that of old men among the Hindus have fallen.

The inset table gives the number of males and females, in each age period, per 10,000 persons of each sex, among the Malayalee and the non-Malayalee Hindus of the State. One out-standing feature noticed is that the proportion of the males in the age periods 0-5, 5-10 and 10-15 is more among the Malayalees than among the non-Malayalees. This may be due to two causes. One is that the proportion of male children born among the Malayalees is greater than that among

Diagrams 15 & 16 showing proportional numbers in each sex at various ages in 1901, 1911 & 1921 Censuses, per 10,000 of all ages.
Diagram 16.

Diagram 17 & 18 showing the ratio of the proportional numbers given in the above diagrams for 1901 & 1911 to the numbers at corresponding ages in 1921.
Diagram 18.

To face page 46.

the non-Malayalees. It will be seen from the appendix to Chapter VI that, among the Malayalees, the ratio of male children to 1,000 female children is 1,116, as against 1,049 among the non-Malayalees.

TABLE SHOWING THE DISTRIBUTION OF PERSONS PER 10,000 IN THE SEVERAL AGE PERIODS.

AGE PERIOD.	MALAYALEE.		NON-MALAYALEE.	
	MALES.	FEMALES.	MALES.	FEMALES.
0— 5 .	1,297	1,314	1,206	1,271
5— 10 .	1,303	1,311	1,265	1,306
10— 15 .	1,280	1,219	1,228	1,211
15— 20 .	934	1,030	981	942
20— 40 .	3,150	3,149	3,231	3,285
40— 60 .	1,610	1,496	1,666	1,506
60 & over .	425	482	424	478

The second cause is the low mortality found among the Malayalee children during the decade, as will be seen from para 94 infra. In the age period 20-60, the non-Malayalees have a greater proportion of males than the Malayalees and the ratios become equal after the age 60. The proportion of female children below the age 5 is smaller among the non-Malayalees than among the Malayalees. This may, perhaps, be due to the fact that female children born are not as much looked after as boys, as they are not much valued among them. The proportion of females between 15 and 20 is higher and that between 20 and 40 is lower, among the Malayalees than that among the non-Malayalees. This may be accounted for in the case of the Malayalees by the rise of the age of child birth, in which the mortality of mother is high, from 15-20 to 20-40, consequent on the advancement of female education and the operation of the Nair Regulation, both of which have the effect of postponing the marriage of their girls to later ages; while, in the case of the non-Malayalees among whom early marriage is still in vogue, the age of child birth with its attendant increased mortality of mothers, continues to remain in the lower age period of 15-20.

89. Age Distribution—General.—According to Sundbârg, the Swedish Statistician, the number of persons in the age group 15-50 should be uniformly about one half of the entire population; and, in a country, where the population is growing, the number in the age group 1-15 must be greater than that in the age period 50 and over. The statement given in the margin shows how the figures are approaching this standard, census by census. In none of the intercensal periods was the natural distribution of the population disturbed by severe famine or epidemic diseases. Subsidiary Table VI will show that, unlike in previous censuses, in which the variations were erratic, the figures of this Census, in the several age periods, are uniform, and that they keep to the average as close as possible.

YEAR.	1-15	15-50	50 & OVER
1881 .	400	497	103
1891 .	362	521	111
1901 .	382	518	100
1911 .	391	507	102
1921 .	396	504	100

several age periods, are uniform, and that they keep to the average as close as possible.

90. Life Tables.—A statement showing the age distribution of 100,000 persons of each sex, by annual age periods, was prepared for the use of the Actuary who works out the mortality rates. For this statement, the slips for the main religions returned in all the census and minor Municipal towns, where the population might be regarded for all practical purposes as representing the State in its normal condition, were taken and tabulated. As, in the Actuarial Table published in the All India Census Report of 1911, separate figures were not given for this State, it is doubtful whether the statement sent from here is being actually examined by the Actuary.

91. Mean Age.—The mean ages calculated from the crude ages without smoothing, as required by the Census Commissioner, for India, are given in the margin and compared with those similarly calculated in 1901 and 1911. It will be seen therefrom that the mean ages of males and females have fallen this time by 0.2 and 0.1, respectively, from those of 1911. If, however, they are calculated from smoothed figures, the mean ages of males and females in 1921 will stand at 24.8 and 24.4 against 24.2 and 23.7, respectively, in 1911. In the Census Report of India for 1901 the mean duration of life was fixed at 26 when the mean age was 24.9, and, from the mean duration of life so fixed, the death

YEAR.	MEAN AGE.	
	MALES.	FEMALES.
1901 .	24.5	23.9
1911 .	24.4	23.9
1921 .	24.2	23.8

rate was determined. It is not stated in that Report how the mean duration of life should be calculated from the mean age. It is seen that, in the United States of America, when the mean age was 26·3 in 1900, the death rate was 17·5. To give this death rate, the mean duration of life should be 1,000/17·5 or 57. How this number could be obtained from the mean age of 26·3 is not known. It does not appear from the above that, the mean age of 24·0 (both sexes) and the death rate of 20 per mille obtained in this State for 1921, are incompatible with each other.

92. Mean Age for each Main Religion.—From the statement given in the margin, it will be seen that, among the several religionists, the Hindus have the highest mean age. This must be attributed either to a high mortality among their children or to a low birth rate. As the proportion of children under 10 is highest among the Hindus, the factor of high mortality can be eliminated from the causes for the high mean age. It has been noticed before that the advancement of education among females and the passing of the Nair Regulation at the commencement of the decade have postponed the ages of mariages among the Hindus, the majority of whom

MEAN AGE OF RELIGION IN 1921.

RELIGIONS.	MALES.	FEMALES.
Hindu .	24·5	24·3
Malayalee .	24·4	24·3
Non-Malayalee .	24·9	24·5
Musalman .	23·6	22·5
Christian .	23·5	22·9

are Malayalees, and limited their number and that, as a consequence, the birth rate has gone down. This must evidently be the cause for the highest mean age of the Hindus. If the two classes of the Hindus, the Malayalees and the non-Malayalees, are taken separately, it will be seen that the mean age is higher among the latter than among the former. As the birth rate of the Malayalees is lower than that of the non-Malayalees, the higher mean age of the latter cannot be due to a low birth rate. An increased mortality of children observed to be obtaining among them (vide para 94 infra), must be the cause for their high mean age.

93. Vital Statistics.—Reference has already been made to the fact that the registration of Vital Statistics in this State, especially in the rural areas, is very unsatisfactory, and that the birth and death figures collected cannot be used with confidence alongside of the populational statistics. But some accuracy may be expected in the figures collected for the Municipal towns where the registration of Vital Statistics is compulsory. From the figures so collected, it is seen that the birth and death rates for the Municipal towns are 32·5 and 22·5 per mille, respectively. If allowance is made for a higher birth rate and a lower death rate for the rural areas, the rates obtained for Municipalities will be found more or less to correspond with those estimated from the Census figures for the whole State and given in para 27. As birth and death figures had not been registered by religion, sex and age, till the end of the last decade, figures under those categories are not available for effecting comparisons with other countries. The rate of infant mortality as calculated from the Municipal figures comes to 136 per 1,000 births and considering that infant deaths are more in places where there are more births *i. e.*, in Rural areas, the infant mortality rate for the whole State can be put down at 150.

94. Infancy and Childhood.—At the side is given a comparative statement showing the number of married women in the age period 15-40 per 100 females of all ages and the

RELIGION.	NO. OF MARRIED WOMEN BETWEEN 15 & 40 PER 100 FEMALES OF ALL AGES.			NO. OF CHILDREN UNDER 10 PER 100 MARRIED WOMEN BETWEEN 15 & 40.		
	1901	1911	1921	1901	1911	1921
All Religions .	33	32	30	162	171	180
Hindu .	32	31	29	159	170	179
Malayalee .			29			183
Non-Malayalee .			32			160
Musalman .	34	33	31	169	177	186
Christian .	35	34	32	167	170	180

females of all ages and the number of children under 10 per 100 married women of the age group 15-40, in each religion, for the last three censuses. The most noteworthy feature observed is that the proportion of the married females in the reproductive ages has been going down from census to census, and that the fall is shared by

all the religions. Another point worthy of note is that, while the proportion of married females has been diminishing, the ratio of children under 10 for every 100 married women has been increasing. Naturally, one would expect that, in proportion to the fall in the number of marriages, the number of children will also come down. The apparent contradiction observed in the ratios can be explained by the fact that the mortality of children has been declining. Taking the Malayalees and the Non-Malayalees separately, it is seen that the proportion of the married among the non-Malayalee women is 31 while it is a little below 29 among the Malayalees. But the peculiarity is that the number of children per 100 married females is only 160 among the non-Malayalees, while it is 183 among the Malayalees. The Non-Malayalees are more or less confined to the taluks of Thovala, Agasteeswarem and Shencottah, where on account of polluted water supply, the habits of the people, etc., cholera and other epidemic diseases causing mortality among children prevail largely, as compared with the other taluks of the State where the Malayalees live. It is not essential that the birth rate should increase in order that the population may grow; but it is sufficient if the death rate decreases, as the increase in population, in the absence of migration, is the difference between the number of births and that of deaths. That the increase of population in this Census is the result of a diminished death rate and not of an increased birth rate, will be seen from the fact that, while the increase of 16·2 per cent. between 1901 and 1911 is made up of an increase of 31·3 per cent. representing the fresh population under 10 years in 1911 and the decrease of 15·1 per cent. due to death in the population of 1901, the increase of 16·8 per cent. found in 1921 is the net result of an increase of 31·3 per cent. which is equal to that in 1911, in the fresh population under 10 years of age in 1921 and a decrease of 14·3 per cent. due to death in the population of 1911, which is lower than that in 1901.

95. Fecundity.—If by “Fecundity rate” is meant the possible number of children a woman can bring forth, the figures collected are not in any way useful in its determination. But, if the term is taken to mean, as is done here, the number of children actually born to women under the conditions of life led by them, the figures are helpful in finding the rate. It is considered that the maturation and fertilisation of ovules, the female germ cells, depend upon environment and chances. But, even the chances of fertilisation are being eliminated, as stated by Dr. Havelock Ellis, by resort to birth control. He says that “the method of birth control by the use of “contraceptive measures is the one and the only method which places in the hands “of the whole population possessed of ordinary care and prudence the complete “power to regulate, limit or if necessary, altogether prevent, the production “of offspring while yet enabling the functions of married life to be exercised without “vain struggle to attain an ascetic ideal or any wasteful impoverishment of physical “or spiritual well being”. Further, according to Herbert Spencer, Professor Freud and others, it is considered that in proportion to the advancement of education and the increase of opportunities for enjoyment of “fuller” life, an increasing portion of the fundamental driving force of the human activities, variously called—*Libido*, *Elan Vital*, etc.—is diverted to the enjoyment of life, leaving a decreasing portion for purely reproductive purposes. Hence, in countries where the above conditions prevail largely, any calculation made from the number of children born and from the proportion it bears to that of the married women in the reproductive ages, to determine the possible number of births, cannot be expected to be correct. That even in Travancore, the postponement of marriages and the education of women, which have been in operation only for the short space of a decade, have affected the fecundity rate, will be seen from the fact that it now stands at 212 for 1,000 wives while it was 247·5 for the whole of India in 1901.

96. Later Age Period.—In the marginal statement is given the number of persons for every 10,000 of the population, in the decennial age periods 10-20, 20-30,

30-40, etc., and in the effective age period 25-40, as found in the last three censuses

AGE PERIOD.	YEAR 1901.	RATE OF VARIATION.	YEAR 1911	RATE OF VARIATION.	YEAR 1921.
1	2	3	4	5	6
10 20	2,117	15.5	2,841	16.8	2,258
20 30	1,839	24.6	1,788	25.0	1,782
30 40	1,435	33.7	1,386	32.1	1,341
40 50	950	39.8	951	40.7	940
50 60	970	..	571	..	563
60 & over	423	..	436	..	435
25 40	3,829	..	3,696	..	3,636

The rates given in the third and the fifth columns of the statement show the variations between the number of persons in one decennial age period and its survivors in the next, and they are printed obliquely between the figures compared. It will be seen that, in all the decennial periods given in the table, except 30-40 between 1911 and 1921, the decrease is higher in 1911-21 than in 1901-11. This is due to the prevalence, though in a mild form, of Influenza in the State during the decade. The decrease in the effective age period in 1921 is 60 against 133 between 1901 and

1911.

97. Centenarians.—The number of persons aged 100 and over enumerated in this Census, was 105 (males 46 and females 59) against 46 (males 24 and females 22) in 1911 and 24 (males 5 and females 19) in 1901. Of these, 77 (32 males and 45 females) are Hindus, 23 (11 males and 12 females) are Christians, 3 (one male and 2 females) are Musalmans and 2 (both males) are Animists. 13 (5 males and 8 females) were enumerated in towns and 92 (41 males and 51 females) in rural areas.

CHAPTER VI.

SEX.

98. Preliminary Remarks.—The subject matter of this Chapter is an important one, particularly, from a scientific point of view. The figures collected should be considered as accurate for the reason that there is no possibility of mistaking one sex for the other. As a supplement to the information collected in the general Census, the Census of the Size and Sex of Families was taken specially this time, with the object, among others, that a sufficiently large mass of material may be made available for the consideration of the important subject of causation or determination of sex, and it is dealt with as an appendix to this chapter, as subjects of this nature require separate treatment.

99. Reference to Statistics.—For the purpose of this Chapter, among other materials, Imperial Tables VII and XIV and the following Subsidiary Tables are made use of :—

- Subsidiary Table I. General proportions of the sexes by Natural and Administrative Divisions.
- II. Number of females per 1,000 males at different age periods by Religions at each of the last 3 censuses.
 - III. Number of females per 1,000 males at different age periods by Religion and Natural Divisions.
 - IV. Number of females per 1,000 males for certain selected castes.
 - V. Actual number of births and deaths reported for each sex during the decade 1891-1900, 1901-1910 and 1911-1920.

100. Proportion of Male to Female Births.—In the statement given in the margin, the number of male for every 1,000 female births is shown, for the 5 quinquennia from 1895, as calculated from the Vital Statistics of the State. For the period from 1895 to 1900, separate figures for rural and urban areas are not available. It will be seen from the figures that the proportions in the different periods and their variations are so marked and wide that they embrace more or less all the proportions given by S. De. Jastrzebski for the whole human race, from 1,037 for Serbocroats to 1,065 for Italians in European races and from 1,040 for Mongolo-

STATEMENT SHOWING THE PROPORTION OF MALE BIRTHS TO 1,000 FEMALE BIRTHS.

PERIOD.	TOTAL.	RURAL.	URBAN.
1895--1900	1,072		
1900--1905	1,029	1,024	1,054
1905--1910	1,032	1,017	1,076
1910--1915	1,038	1,029	1,120
1915--1920	1,037	1,026	1,114

Dravidians to 1,070 for Mongoloid in Asiatic races. The few other nations which show higher proportions are the Jews (1,091), the Aryo-Dravidians (1,082), the Indo-Aryans (1,097) and the Turko-Iranians (1,236). Another fact which is made clear by the figures is that urbanisation, which is said to have the effect of lowering masculinity in European countries, has a quite contrary effect here. The theory that, when a particular sex is wanted, the proportion alters accordingly, has no support so far as the figures of this State are concerned. Here, among the Hindus, there are two chief divisions, the Malayalees and the non-Malayalees. Among the former, the inheritance is through females and in consequence female children are much valued and wanted; while, among the latter, in whom the inheritance is through males, male children are desired. But, the actual proportions found, *viz.*, 896 female births among the Malayalees and 953 among the non-Malayalees, for every 1,000 male births, go contrary to the wish-theory.

101. Ratio of females and males in the population enumerated in the Census.—That the proportion of females to males has been decreasing from census to census will be evident from the figures given in the margin; and this

1921	971	984	926	953

mans show a slight increase in 1911 and the Hindus alone in 1901. As the accuracy of the enumeration is increasing from census to census, the gradual decline found in the proportion of females to males cannot be attributed to any omission on the part of the enumerators to return females. The cause for the decrease appears to be that the mortality of males, which is generally more than that of females, has been declining. Though, for the State as a whole, the number of females enumerated is less than that of males, the taluks of Thovala* (1,019), Agastiswaram* (1,023), Chirayinkil

(1,046), Quilon (1,004), Karunagapalli (1,011), Karthigapalli (1,002) and Kunnathunad (1,012) show higher numbers. The same phenomenon was observed in 1901 and 1911 in all the above taluks and, in 1911, in Shencottah also. That, in all the censuses, the proportion of females has been more than that of males in these taluks, demands explanation. As regards the taluks of Thovalai, Agastiswaram and Shencottah, this high ratio may be due, among other causes, to the high proportion of female children born among the non-Malayalees who chiefly inhabit these taluks and to the emigration of males to the adjoining British districts. The increase in Chirayinkil and Quilon is the result of the emigration from those taluks of a large number of males to Ceylon, Singapore and other places outside Travancore. In Karunagapalli and Karthigapalli, a considerable number of males engage themselves in plying boats between Quilon and Alleppey and as such spend most of their days in boats, visiting their houses only occasionally. As these men are enumerated not in their houses but mostly elsewhere in other taluks, the proportion of women appears high. The increase observed in Kunnathunad is caused by a large number of the male population of the taluk having emigrated to the tea and rubber estates of the High Range Division.

102. Variation in Age—Age period and Age Curves.—Starting from 964 per 1,000 males, at birth, the female proportion rises up to 1,001 at the end of the first year and then gradually goes down till it reaches 945 at the end of the 14th year. From the 15th year, it pursues an upward course rising up to 1,033 and 1042, in the age periods 15—20 and 20—25, respectively, and then goes down to 1007 in 25-30 and continues in the downward course till the 60th year when it again rises to 903 and goes up to 1,061. In the graphs given on the opposite page, are shown the variations in the number of females for every 1,000 males at each age period, observed in each religion, in the last 3 censuses. The peculiarity noticed, contrary to general expectation, is that the proportion of females is more between 15 and 30, the period of child birth, than in other periods. That this feature is common to all the four censuses proves that it cannot be attributed to inaccurate enumeration. The same peculiarity is observed in other parts of India also, though not so regularly as in this State. The following may perhaps explain the peculiar feature found here. In this State where the majority of the people follow Marumakkathayam law of inheritance, female lives are considered more valuable and in consequence better taken care of than in a place where Makkathayam law of inheritance is in operation. For confinements, the attendance of skilled midwives is largely resorted to in the State. During the decade, the number of births that were attended to by the medical officers and trained midwives attached to hospitals, was 36,633.

103. Factors contributing towards the lowering of the proportion of females.—Taking one by one the chief factors adduced as reasons for the lower proportion of females found in the population of India, *viz.*, (a) Infanticide, (b) neglect of female children, (c) evil effects of early marriage and

* The figures given are for the Taluks before the reorganisation.

premature child bearing, (d) high birth rate and primitive methods of midwifery, (e) hard treatment accorded to women, and (f) hard work done by women, it will be seen that female infanticide and neglect of females are unthinkable in a country where the law of inheritance is through females, among the majority of the population. The evil effects of early marriage and premature child bearing and of high birth rate and primitive methods of midwifery, are out of the question as the figures disclose that the ages of marriage have been advancing, that the birth rate has been decreasing and that the services of trained midwives have been increasingly resorted to. The factors—hard treatment accorded to women especially widows and hard work done by them—are not in operation in this State where, under the Marumakkathayam law of inheritance followed by the majority of the people, female lives are more valued than male ones. During the decade, neither epidemics nor famine caused any disturbance to the proportion of females to males. The excess of females over males found in the taluks where the non-Malayalees abound is to be attributed, as already stated, to the larger proportion of females born among the non-Malayalees and also to the greater volume of emigration, particularly of males.

APPENDIX TO CHAPTER VI.

SPECIAL ENQUIRY INTO THE SIZE AND SEX CONDITIONS OF FAMILIES IN TRAVANCORE.

The Object and the Method of Enquiry.—The object of the enquiry is four fold. The first is to find out the effect of the Nair Regulation passed in 1910 and of education among females, on the sex and size of families and on the fecundity of women. The second is to ascertain the proportion of female to male children, in the first born. The third is to determine the proportion of females to males in births subsequent to the first. And the last is the consideration of the factors which determine or ~~cause~~ the sex. The enquiry was conducted in towns where there were facilities for it; and the work was entrusted to the permanent conservancy staffs of the towns. The enquiry was commenced on January and completed by April, 1921. The schedules which contained the following columns were stitched into books and instructions were printed on the wrappers for filling them up:—

(1) Name of Ward or Kara ; (2) Census Number of the House ; (3) Age of Mother ; (4) Caste ; (5) The number of Years of Married Life ; (6) Number of Children born (Male and Female) and (7) Sex of the First Born.

The defects mentioned in the Report of the Central Provinces for the last Census, were avoided by confining the enquiries to married women or widows of not less than 35 years of age. The age 35 was fixed, as births after that age are rare among Indian women. Thus, in cases of married women aged 35 and upwards, the families are complete; and, by confining the enquiries to the mother, the influence of polygamy and re-marriage was eliminated. The information collected in respect of widows is made use of in finding out the proportion of females to males, in births subsequent to the first and with reference to the age of mother. Taking the age at which Indian women commence child bearing as 15, if the number of years of married life led by women be 1 to 5, the age of mother will be 15 to 20 and so forth.

2. Number of Families dealt with.—The total number of families, in respect of which information is collected, is 37,641 and the figures are tabulated in the annexed 3 statements for 6 castes and 3 religions. The castes whose marital conditions and social customs differ from one another are selected. Thus, among Brahmins, the Malayala and the non-Malayala Brahmins are separately taken. Among the Malayala Brahmins, the first son alone marries and some girls remain unmarried for the whole of their lives. Among the non-Malayala Brahmins, it is their social custom that every girl should be married before attaining puberty. So also, the non-Brahmins have been divided into the Malayala non-Brahmins and the non-Malayala non-Brahmins. Among the majority of the Malayala non-Brahmins, inheritance is through females; education has spread more than in any other community; marriage is optional; and infant marriage is extremely rare. Among the non-Malayala non-Brahmins, inheritance is generally through males; infant marriage is common; and education is not so widespread.

Statement I shows the number of children born to women who have had 20 years of married life and more.

Statement II depicts the sex of the first born.

Statement III gives the sex of births subsequent to the first to women having married life extending over years 1 to 5, 6 to 10, 11 to 15, 16 to 20 and 21 and over.

3. Size of Families.—It will be seen from statement I that, among the Malayala Brahmins, in whom marriage is limited, the size of the family is only 4·9, while, among other Brahmins, in whom marriage is compulsory, the size is 5·0. The

size of the family in the case of the Malayala non-Brahmins who marry late and are educated is 5.4, and, among the non-Malayala non-Brahmins, who marry young and are backward in education, it is 5.5. The Christians in whom widow marriage is common, the size of the family is largest being 6.3, while, among the Musalmans, it is 5.5.

4. Sex of the First Born.—From statement II, where the sex of the first-born is shown, it is seen that the proportion of the first born males for every 1,000 females is 1,253. The proportion of males is greater in all the castes.

5. Sex of Children Born subsequent to the First.—The sex of births, subsequent to the first, to women having married life extending over years 1 to 5, 6-10, 11-15, 16-20 and 21 and over, is shown in statement III. Considering that women in India marry at and begin to bring forth children from 15 years of age, the above periods correspond to the age periods of mothers 15-20, 21-25, 26-30, 31-35 and 36 and over, respectively. Taking all the castes and religions together, it will be seen that the proportion of females to males gradually increases from 709 for every 1,000 males in the first period, to 940 in the last. This is very significant and is a sure indication that the proportion of female births increases with the advancement of the age of mothers.

6. Determination or Causation of Sex.—In the latest report on the subject of Sex by S. De. Jastrzebski, while figures are collected to show the proportion of male to female births in different places and climates and in times of war, epidemics and famine, the specific death rates of females and the connection between the ages of father and the proportion of sex, etc., no statistics are given to show the proportion of the sexes in births subsequent to the first. In the birth registers maintained in the Municipalities of this State, provision has been made to note the age of mother and the order of birth in every case registered. It is therefore possible to get statistics regarding the proportion of males to females in births subsequent to the first and also the connection between the age of mother and the proportion of sex, if the registers are maintained correctly. This work has to be done leisurely and statistics have to be collected annually. However, in the special Census made about the Size and Sex of families, sufficient information is available for the consideration of the subject.

7. The effect of Vitality of Mothers on the sex of Children born.—Among Europeans it is said that, in a large family of children born in rapid succession, causing much exhaustion to the mother, the last born has Mongolian eyes. In the case of Rotifers, Waterfleas and probably Aphids, it is clearly shown recently that the nutrition of the mother affects the sex of the offspring. These facts and the large mass of figures collected and exhibited in statement III go to show that the vitality of mothers determines the type and sex of children born. So far, the grounds are firm to stand upon. The variations in the proportion of male and female births observed in a few cases in the several castes and religions and the several age periods, may be due to special causes tending to the increase or decrease of the vitality of mothers and are not therefore to be looked upon as, in any way, disproving the above observation. But, why the children born, when the vitality of the mother is impaired, should be females, is rather a difficult point for settlement. Among breeders of race horses and birds it is a common knowledge that if the vigour of the species is not kept up by proper selection of mates, the tendency will be, in course of time, for them to revert to the original types. It is also considered that the female sex was evolved earlier than the male. To infer from the above that, as the vigour of the mother gets exhausted, the children born reverts to the original type (female) is therefore not unnatural.

8. Conclusion.—One of the criterions by which the correctness of a science is judged is by its universal applicability. In the Chapters on Age, Religion, and Movement of Population, facts will be found to indicate that the variations in the birth, death and fecundity rates observed among different races are not inherent

in the races themselves but depend upon the conditions of life led by them. Similar facts gathered now in the matter of sex afford further instances indicating that the differences of the nature described above, and observed among the several races of mankind are, to a large extent, due to environment rather than to any inherent quality among them. It is not to be thought that I am formulating a theory of my own. In the Census Report of India for 1901, the late Sir Herbert Risley wrote, after studying all the facts and figures given in the Census Reports, that the balance of probability, if any, seemed rather in favour of the view that mal-nutrition on the part of the females tended to the production of female children. From my limited study and observation, I was inclined to hold the same view and took this Census as an opportunity to collect further facts to be placed before the scientific world, for the consideration of the whole subject.

I. Statement showing the number of children born to women of 20 years of married life and more.

Caste or Religion.	Number of families.	Male.	Female.	Average number per family.	Remarks.
Brahmin Malayalee	74	196	167	4.9	Proportion of females to 1,000 males in Malayalees is 896 and in non-Malayalees is 953. Or the proportion of males to 1,000 females is in Malayalees 1,116 and in Non-Malayalees 1,019.

CHAPTER VII.

CIVIL CONDITION.

104. Preliminary Observation.—With the differentiation of sex and the resulting bi-sexual reproduction, minute variations tending to the further evolution of the species are produced. The spermatozoa expelled in sexual congress are considerably more than, and out of all proportion to, the number required for the fertilization of the limited number of ovules. In all animal lives, there is struggle for fertilization and before a spermatozoon enters an ovule, a large number perishes. This indicates that it is not the rule that every male and female born should join in matrimony. The marital state in human beings is determined fundamentally by the conditions of life lead by people at different stages of development; and the rules framed on marriages and the ceremonies connected with them are mainly the codification of the practices obtaining among them from time to time. In the hunting and pastoral stages, demanding constant movement from place to place, the marriage is restricted to the chief men of the groups. In the agricultural stage, with fixity of residence and necessity of the services of women for agricultural operations, marriage is rather universal, while, in the militant stage, when the services of singlemen are required for warfare and those of single-women for nursing, marriage cannot become general. Again, in the commercial and industrial stages, necessitating frequent and long travel and continued absence from home, marriage must become limited.

105. Reference to Statistics.—

Imperial Table VII. Civil Condition by Age, Sex and Religion.

XIV. Civil Condition of certain selected castes.

Subsidiary Table I. Distribution by Civil Condition of 1,000 of each Sex, Religion and main Age Periods at each of the last 3 censuses.

II. Distribution by Civil Condition of 1,000 of each Sex, at certain ages in each Religion and Natural Division.

III. Distribution by main Age Periods and Civil Condition of 10,000 of each Sex and Religion.

IV. Proportion of the Sexes by Civil Condition at certain ages for Religions and Natural Divisions.

V. Distribution by Civil Condition of 1,000 of each Sex at certain ages for selected castes.

VI. Civil condition of Non-Malayalees.

106. The Nature of the Statistics.—The instructions given to the enumerators this time were the same as in the last Census, *viz.*, to enter each person, whether infant, child or grown up, as either married, unmarried or widowed, divorced persons being included under the last category. In the case of some of the Malayalees who go through two forms of marriage, *viz.*, “the mock marriage of Thalikettu” and “the Sambantham” or union by cloth presentation, “sambantham” was treated as marriage. Though “Thalikettu” is growing out of fashion among the educated sections of this community, its stoppage has not become universal. Malayala Brahmins who have contracted sambantham alliance with non-Brahmin females were also treated as married. Prostitutes, as a class, do not exist in any appreciable number in Travancore, and, as such, there is no room for falsification of statistics in the case of persons who, though they are not married, desire to appear so. Polygamy is rare and polyandry is rarer, and the few cases of the latter found are of the fraternal type. Hypergamy continues among the Kshathiriyas and Ambalavasis, while it is becoming decadent among the other Malayalee Hindus.

107. Conditions as to Marriage.—Of the 4,006,062 persons enumerated, 2,126,575 are returned as unmarried, 1,569,896 as married and 309,591 as widowed. Among the unmarried, there are 812 females to every 1,000 males, and, among the married, there are 994 wives to every 1,000 husbands. The aggregate number of husbands exceeds the total number of wives by 4,960. The number of widows is 238,001, against a total of 71,590 widowers, giving a proportion of 3,325 widows to every 1,000 widowers. In 1911, for the whole of India, the number of wives

enumerated for every 1,000 husbands was 1,011. In England, the number was 1,029, while, in the United States of America, it was 977.

108. The Meaning of the term Marriage is different in India from that in other countries.—For instituting comparisons with other countries, it is necessary that the data compared should be similar. The term “marriage” is understood in one way in India, and in a different way, in other countries. Marriages of boys and girls of 15 years of age and under being only betrothels, their number should be excluded from the Indian figures, before they are used for comparison with those of other countries. As widow marriage is more common in countries outside than in India, the figures for married persons in India can be correctly compared with those in other countries, only if the numbers for widows and for married persons over 15 years of age, are added together. In European countries, divorced persons are also included among widows. But, in this state, as in India, divorce is rare; and even in the few cases where it does exist, it is more the result of social than of legal procedure. The majority of divorced persons practically return themselves as married. If these points are considered, it will be seen that the best data that have to be taken for comparison are the figures for unmarried persons of 15 years and over. The marginal table compares the proportion of the unmarried in Travancore, per 1,000 of each sex, in the different age periods, with that observed in India, England and the United States of

STATEMENT SHOWING THE PROPORTION OF UNMARRIED PERSONS IN THE SEVERAL AGE PERIODS PER 1,000 OF EACH SEX IN EACH AGE PERIOD.

NAME OF COUNTRY.	SEX.	15 & OVER.	15-20	20-25	25-35	35-45	45-65	65 & ABOVE.
India	{ Male.	184	672	379	138	55	39	38
	{ Female.	39	163	43	23	13	10	14
Travancore	{ Male.	304	912	604	202	54	39	53
	{ Female.	153	501	153	68	58	76	94
United States of America	{ Male.	387	983	749	350	167	101	62
	{ Female.	297	879	483	209	114	80	63
England	{ Male.	403	998	857	386	169	110	80
	{ Female.	390	988	757	355	196	145	121

tural than India, has a higher proportion of the unmarried; while, in England, where the majority of the population are employed in industrial and commercial enterprises, the ratio of the unmarried is highest. If expressed in other words, the proportion of persons who have gone through the matrimonial process is highest in India, 816 males and 961 females, followed by Travancore, with 696 males and 847 females and America, with 613 males and 703 females, and is lowest in England, 597 males and 610 females.

109. The Marital Condition in Travancore.—Though Travancore has a large proportion of its population engaged in agriculture, its marital condition differs considerably from that of the rest of India and tends more and more to conform with that obtaining in the United States of America. Among males, in this State, the number of the unmarried aged 15 and over is 304 per 1,000, which is nearer to 387 in America and 403 in England than to 184 in India. Similarly, among females, the number of the unmarried over 15 years of age, is four times as much as in India, while it is less than twice the number in America and thrice in England. The number of bachelors in the age group 15-20, 912, is closer to 983 in America and 998 in England than to 672 in India, while the number of maidens under the same age group stands at 163 in India as against 501 in Travancore, 879 in America and 988 in England. At the other end of life, for every 38 old bachelors in India, there are 53 in Travancore, 62 in America and 80 in England. The proportion of old women in Travancore who prefer to end their lives in single blessedness, is seven times that in India, one and a half times that in America and one-third less than that in England.

110. The Reasons for the Isolated Condition of Travancore.—The reasons for the isolated position maintained by the State when compared with the rest of India, in regard to marital condition, will be found in the fact that the people of Travancore are slowly becoming industrial and that education, particularly among females, is advancing at rapid strides. For every 122 males and 12 females, out of 1,000 of each, who know to read and write in India, there are in Travancore 380 and 171, respectively.

111. Infant and Early Marriages.—An important feature of the Indian statistics as compared with those of Europe, is the early age at which marriage takes place in this country. But, for the reasons given in the foregoing paragraph, child marriage in its extreme form is totally absent in this State, while wedded life up to the age 15 is much less common than elsewhere in India. An examination of the comparative table given in the margin will show that, in this State, not one of either sex is returned as married at the age of 5 and below,

SEX AND AGE.		NO. MARRIED PER 10,000 OF EACH SEX IN EACH AGE PERIOD.	
		Travancore.	India.
Male.	0—5	0	71
	5—10	8	366
	10—15	54	1,289
Female.	0—5	0	138
	5—10	16	1,051
	10—15	545	4,306

while, in India, 71 males and 138 females, out of every 10,000 of each sex, are married. In the next quinquennium, the numbers that are married are trifling and amount to only 8 in the case of males and 16 in that of females, against 366 and 1,051 in India. Even in the succeeding age period, the tendency to enter matrimonial life is but faintly disclosed in this State. It is seen that, in the age period 10—15, only 54 of the males and 545 of the females are under marital tie here, whereas, in India the corresponding numbers are

1,289 and 4,306. It is only when the 15th year is completed that the population indicates a general tendency to discard single life and to take to partnership.

112. Proportion of Widows.—In Travancore, out of the females of all ages, 12 per cent. are widowed, whereas, in the entire female population of India, widows form 17 per cent. Of the widows in Travancore, one per mille is under 15 years of age, 107 are between 15 and 30 and the rest over 30 years, the corresponding figures for India being 13, 280 and 707. In this State, remarriage of widows is prohibited neither among the Malayalees who form the great majority of the Hindu population nor amongst the adherents of the other religions. This greatly curtails the number of widows. In the comparatively advanced age at which girls are married here, owing to the spread of education and the non-existence of the custom of prepuberty marriage, and, in the approximation of the ages between husbands and wives, there are further causes for the low proportion of widows. Even with regard to the number of widowers, this State differs from India. While the percentage of widowers here is 4, that in India is 5; and this may be partly attributed to the fact that widowers who abhor contracting union with widows can find here grown up unmarried girls for their mates.

113. The selection of Age periods for the discussion of Marital Conditions.—The marital conditions of the whole population in all religions and in each main religion, as they were returned in this Census, are shown in the 4 diagrams given on the opposite page. The variations in the number of the married, the unmarried and the widowed found during the last 3 censuses will be taken up for discussion. In effecting the comparison, it is important to take the age periods 0—15, 15—20, 20—40 and 40 and over, in the case of both males and females and 15—40 in the case of females alone. The age period 0—15 is important, as marriages below 15 are only betrothels; the age group 15—20 or the school going age is taken, as the effect of education on marital condition could be seen; 20—40 is the middle or effective age period; the age period 15—40 is valuable, since it is the reproductive age of females; and the age period 40 and over is selected, as, after 40, there is no likelihood of re-marriages taking place.

Unmarried Married Widowed

Diagram 25.

114. All Religions.—From the statement given in the margin, it will be seen that the proportion of the married persons below 15 years of age has been declining from census to census.

STATEMENT SHOWING THE PROPORTION OF MARRIED PERSONS IN THE SEVERAL AGE PERIODS TO 1,000 OF EACH AGE PERIOD.

Year.	Sex.	0-15	15-20	20-40	40 and over.
1901	Male	4	139	750	833
	Female	28	560	833	772
1911	Male	4	132	735	838
	Female	27	571	828	768
1921	Male	2	86	684	832
	Female	24	484	811	730

fall from 772 in 1901 to 730 in 1921.

115. Musalmans.—No appreciable decline is seen in the proportion of the married males below 15 years of age; but, in the ratio of the married females, there is a marked decrease, from 25 in 1901 to 17 in 1921.

STATEMENT SHOWING THE PROPORTION OF MARRIED PERSONS IN THE SEVERAL AGE PERIODS TO 1,000 OF EACH AGE PERIOD.

Year.	Sex.	0-15	15-20	20-40	40 and over
1901	Male	3	104	749	879
	Female	25	587	866	802
1911	Male	1	72	717	885
	Female	21	617	863	806
1921	Male	3	48	662	872
	Female	17	527	837	763

116. Christians.—The proportion of the married below 15 years has fallen considerably both among males and females. In 1901 the proportions were 8 and 43 while, in 1921, they have come down to 3 and 23, respectively.

STATEMENT SHOWING THE PROPORTION OF MARRIED PERSONS IN THE SEVERAL AGE PERIODS TO 1,000 OF EACH AGE PERIOD.

YEAR.	Sex.	0-15	15-20	20-40	40 & over
1901	Male	8	273	848	839
	Female	43	700	893	845
1911	Male	6	276	839	836
	Female	43	691	892	845
1921	Male	3	170	790	836
	Female	23	577	872	806

117. Hindus.—Reference has already been made to the fact that the Hindus in Travancore fall under two separate tribes, the Malayalees and the Non-Malayalees. They differ from each other in habits, mode of life, law of inheritance, etc. Hence, it will be interesting to know the marital conditions of each of these classes. But, as separate

declining from census to census. In the school going age, on account of the spread of education, a fall is noticed both in the proportion of the married males and of females. The ratio of the males has decreased from 139 in 1901 to 86 in 1921, while, that of females, from 560 in 1901 to 484 in 1921. In the reproductive ages of females also, there has been a continuous

fall in the proportion of married males is considerable, from 104 in 1901 to 48 in 1921 or by over 54 per cent., while, that in females, it is not so marked. In the reproductive ages also a decrease is noticed. For every 802 married women in 1901, there are only 763 in this census.

in the proportion of the married males and females of the school going ages also. From 273 and 700 in 1901, the proportions have gone down to 170 and 577, respectively, in 1921. The numbers in the reproductive ages show a decrease only in this Census. As against 845 in each of the censuses of 1911 and 1901, the present ratio is 806.

figures for them are not available for previous censuses, the figures for the

STATEMENT SHOWING THE PROPORTION OF MARRIED
PERSONS IN THE SEVERAL AGE PERIODS TO
1,000 OF EACH AGE PERIOD.

YEAR.	Sex.	0—15	15—20	20—40	40 & over.
1901	Male	3	95	715	827
	Female	20	513	811	416
1911	Male	2	78	695	834
	Female	22	517	801	414
1921	Male	1	50	633	827
	Female	15	436	782	306

whole Hindu religion will be taken for comparison, so far as 1901 and 1911 are concerned; and the difference between the marital conditions of the two classes will be pointed out separately, for this Census. It will be seen from the marginal table that the fall in the proportion of the married males under 15, from 3 in 1901 to 1 in 1921, is marked, though it is not so prominent in the case of

married females in whom the decrease is only from 20 to 15. But, in the school going age, the decrease in the number of married males, from 95 in 1901 to 50 in the present Census, is very striking. The fall in the proportion of the females of that age, from 513 in 1901, to 436 in 1921, is also appreciable. The proportion of unmarried females in the last age period is the lowest of all religions and lower than that in 1901 by 110. This may show that widows, particularly pretty and wealthy, are sought after more than virgins in the matrimonial markets here as in European countries. In the reproductive ages 15-40, as compared with the proportions in 1901 and 1911, there is a marked decrease in 1921. But, why there was an increase in 1911 as compared with 1901 cannot be correctly accounted for.

118. The Non-Malayalee Hindus.—From the statement given in the margin it will be seen that, in the matter of civil condition, the difference between the Malayalees

STATEMENT SHOWING THE PROPORTION OF MARRIED
PERSONS IN THE SEVERAL AGE PERIODS TO
1,000 OF EACH AGE PERIOD.

	Sex.	0—15	15—20	20—40	40 & over.
Malayalee.	Male	1	49	629	824
	Female	13	428	769	431
Non-Malayalee.	Male	2	56	679	844
	Female	28	481	842	414

and the non-Malayalees among the Hindus is marked. The proportion of married females under 15 is lowest among the Malayalees (13) and highest among the non-Malayalees (28) as compared with that of all other religions, indicating that infant marriages are most common among the non-Malayalees. In the next age period

15-20, the proportion of married females is lowest among the Malayalees (428) against (481) among the non-Malayalees. In the reproductive ages, the proportion of the married among the Malayalees is 685 against 762 among the non-Malayalees. These are significant and result in the lower birth rate found among the former.

119. Marital Condition by Natural Divisions and Rural and Urban Areas.—From Subsidiary Table I, it will be seen that the proportion of the married is lowest in the Sea-Coast Division, 364 among males and 370 among females, and highest in the Mountainous Division, 417 among males and 427 among females, and that it stands between the two, in the Inland Division, with 399 and 422. As the chief trading and industrial centres of Travancore are situated in the Sea-Coast Division, the proportion of married persons can naturally be expected to be low there. The absence of any large scale industry or trade and the cultivation of tapioca and other garden products account for the higher proportion of the married in the Inland Division.

The highest proportion found in the Mountainous Division may be attributed to the large number of immigrant coolies working in the rubber and tea estates of the Division who are mostly non-Malayalees, among whom marriage is more universal than among the Malayalees. In Urban areas, the proportion of the married males and females, per 1,000 of each sex, is 385 and 397, respectively, while, in Rural areas, the corresponding figures are 449 and 397. The low proportion of married males in the Urban areas is the result of their having a large number of schools with students who are mostly bachelors.

CHAPTER VIII.

EDUCATION.

120. Introductory Remarks.—In no time or country can the importance of education be over-estimated. It has an intimate bearing not only on the literary attainments of the people, but also on their civil condition, occupation, birth and death rates, e c. For the correct appreciation of the progress in education, for instituting comparison with the literacy of other Provinces and States and even for administrative purposes, it is desirable to have a clear conception of the various expressions, such as, Primary Education, School Going Age, etc., which are met with in reports on education. In some countries, these terms are defined with reference to the age of pupils and in others with reference to the standard of instruction imparted. In this State, Elementary Education, which includes Primary Education of other Provinces, is defined as the instruction imparted in classes I to IV of Vernacular Schools, while the school going population, by which is meant the number of persons of school going age, is taken as 15 per cent of the total population. The census figures for literacy are required to be sorted for 3 quinquennial age periods only *viz.*, 5-10, 10-15 and 15-20. To gauge correctly the progress of education, it is desirable to sort the figures for two more periods 20-25 and 25-30. However, in this Census, as required by the Census Commissioner for India, figures have been tabulated for the age period 20-30 also, with a view to ascertain how far literacy once acquired is retained afterwards. It was the practice in previous censuses to calculate the proportion of literates on the total population. As children under 5 years of age could not be expected to be literate, their number is required to be excluded this time from the total population, in making the calculation. This is certainly an improvement; but, it does not go far. To attain the standard fixed in the Census for literacy *i. e.* to write a letter to a friend and read his reply, at least, primary education should have been completed. Taking that children begin instruction at 5, it would take five years *i. e.* to their tenth year, to complete primary education. It seems reasonable therefore that, in calculating the proportion of literates, children under 10 years of age should be excluded, instead of under 5. At any rate, it is done so in the United States of America.

121. Reference to Tables.—The data for the discussion of the subject dealt with in this Chapter are contained in the following Tables :—

- | | |
|----------------------|---|
| Imperial Table VIII. | Education by Religion and Age. |
| IX. | Education by selected Castes, Tribes and Races. |
| Subsidiary Table I. | Literacy by Age, Sex and Religion. |
| II. | Literacy by Age, Sex and Locality. |
| III. | Literacy by Religion, Sex and Locality. |
| IV. | English Literacy by Age, Sex and Locality. |
| V. | Progress of Literacy since 1901. |
| VI. | Literacy by Caste. |
| VII. | Number of Institutions and Pupils according to the Returns of the Education Department. |

122. The Scope of the Returns.—For the purpose of Census statistics, literacy is defined as ability to read and write any language. Up to 1891, a distinction was made between persons 'able to read and write' and those 'learning.' This distinction having caused the two classes to overlap each other, it was decided in 1901 to confine the entry in the Enumeration Schedules to the two main categories of 'literate' and 'illiterate.' But, for want of a standard as to who should be considered literate, the literacy figures of that year were vitiated by the inclusion therein of the statistics of persons who could only sign their names or laboriously spell out a printed book. Hence, the standard was fixed in 1911 that a person should be regarded as literate only if he could write a letter to a friend and read the answer to it, but not otherwise

The same instructions were issued this time also. If a person was literate in more than one language, all those languages were recorded. Information regarding the number of persons able to read and write English was also noted in a separate column.

123. Extent of Literacy—General.—Of the total population of the

PROVINCE OR STATE.	NUMBER PER 1,000 WHO ARE LITERATE EXCLUDING PERSONS UNDER 5.		
	Persons.	Male.	Female.

Bengal ...	104	188	21
Other States and Provinces.	Below 100

State, excluding children under 5 years of age, 968,133 persons, or 279 for every one thousand, are literate according to the present Census. Among men, two in every five, and, among women, two in every twelve, are able to read and write. In other words, for every twelve literate males, there are five females who have acquired the standard. The marginal table compares Travancore with other States and Provinces in point of literacy. It will be seen therefrom that, in the literacy of both the sexes put together and in the education of males, Travancore takes the second place among the British

Provinces including Burma and Indian States, while, in female education, it occupies the first place. The phenomenally advanced position of Burma, as compared with Travancore, in regard to male literacy, is the result of its indigenous system of free education, evidently of a religious character, imparted in monasteries. If the standard on which the statistics collected for literacy had been a higher one, the relative position of Travancore and Burma, with regard to male literacy, would have been materially altered, since, as is seen from para 354 of the Census Report of India for 1911, "there are comparatively few in Burma who have received a University Education or studied in a High or Middle School." Comparison with European countries is not possible, as figures are not available for them. But, it can be said even without the figures that Western countries are far ahead of India in the matter of literacy both among males and females. Though this is a well known fact, it may not be so widely known that, in the United States of America, the proportion of literates among the Negroes is considerably higher than that in any Province or State in India. According to the Census figures of 1910, the proportion of literates among them, calculated on their population over 10 years of age, was 696 for every one thousand (699 among males and 693 among females), against 330 (449 among males and 207 among females) in Travancore. For instituting comparison with Asiatic countries outside India, statistics are not available except for Ceylon. In the case of Ceylon, excluding Maldives, the proportion of literates per mille of the total population is 337 (482 among males and 179 among females) and this ratio is higher than that for any Indian State or Province. In Maldives, where the education is of the nature given in the Monasteries of Burma, the proportion is much higher, being 410 per mille, (449 among males and 366 among females).

124. Literacy by Natural Divisions.—From the figures for Natural Divisions given in Subsidiary Table II, it will be observed that the proportion of literates is highest in the Inland, and lowest in the Mountainous Division. In every thousand persons of each sex, 424 males and 206 females are able to read and write in the Inland Division as against 377 males and 173 females in the Sea-Coast region and a still lower proportion of 333 males and 131 females in the Mountainous tract. The predominant position which the Inland Division occupies in this respect is the result of its having greater educational facilities and its being the home of a large proportion of the Malayalee Hindus and the Syrian Christians among whom education has much advanced. Of the 4,156 educational institutions in the State, recognised and unrecognised, about 38 per cent. are in this Division. For every 801 inhabitants and 0.9 square mile of area, there is one school in this region. The large animistic and labour population of the Mountainous Division and

the comparatively less number of schools therein account for the low proportion of literates found in that Division. There is only one school for every 1,090 inhabitants and 6 square miles of area in this tract. The Sea-Coast Division, in which are situated the important trading centres and markets and where the proportion of the Musalman population is largest, occupies a middle place. In this Division there is one school for every 1049 inhabitants and 0·8 square mile of area.

125. Literacy by Administrative Divisions.—Taking the Administrative Divisions, it will be seen from Subsidiary Table II that the proportion of literates is highest in the Northern Division where the Christian element predominates and lowest in the High Range Division where illiterate coolies bulk the population.

Division.	Literate per mille.	Number of persons per sq. mile.
Northern	302	540
Central	289	573
Southern	243	776
High Range	145	51

The Central Division which contains 2 out of the 5 major Municipal towns of the State and the Southern Division in which the Capital of the State is situated occupy only intermediate places. The one outstanding feature of the proportions for the several Divisions is the want of correlation between literacy and density. It will be seen from the marginal table that, if the High Range Division which stands altogether on a different basis is excluded, the Northern, the Central and the Southern Divisions which take an ascending order in respect

of density stand in a descending order in point of literacy.

126. Literacy in Towns.—As must be expected, the proportion of literates in towns is much higher than that in rural parts. The average for the 19 Municipal towns of the State is 593 literate males and 251 literate females, to every 1,000 of each sex, compared with the State average of 380 and 171, respectively. The proportional figures for the literates in the 5 major Municipal towns are given in the inset. It will be seen therefrom that, in respect of male literacy, Trivandrum takes the lead with a proportion of 750 per mille. This is due to the fact of it-

Town	NUMBER PER MILLE.	
	Male.	Female.
Trivandrum	750	350
Nagercoil	672	161
Kottayam	639	436
Quilon	547	239
Alleppey	362	162

being the Head Quarters of Government with a large number of offices, schools, colleges and trading institutions. Nagercoil comes next with 672 literate males. It is the centre of the activities of the London Missionary Society, whose contribution towards the spread of education in the State is large. Kottayam and Quilon come next in order and Alleppey occupies the last place. As regards female literacy, Kottayam heads the list, with a proportion of 436.

The reason for the high rank which Kottayam occupies in this respect is obvious. The Syrian Christians, whose ladies stand foremost among the women of the several religious persuasions in the matter of literacy, constitute a large portion of the population of this town. Next follow in order Trivandrum, Quilon, Alleppey, and Nagercoil with a proportion of 350, 239, 162 and 161 respectively.

127. Literacy by Age and Sex.—The marginal table sets out the number of literates per hundred at each age period. It will be seen therefrom that, among

Age period.	LITERATES PER 100		
	Persons.	Male.	Female.
5—10	14·1	13·5	14·8
10—15	28·5	35·6	21·0
15—20	32·9	43·6	22·5
20 and over	30·3	44·0	16·2

persons of both sexes, the proportion is highest, 32·9 per hundred, in the the age period 15-20. But, among males, the proportion rises continuously from 13·5 in the age period 5-10 to 35·6 in 10-15, to 43·6 in 15-20 and to 44·0 in 20 and over. In a country like Travancore, where there has been steady increase in the educational facilities since the commencement of the last decade and where Government have undertaken the responsibility of imparting primary education to children, a high proportion of literates in the age

period 15-20 can easily be explained. It is the population of this age period that has just passed the ordinary primary school going age and that has had the opportunity of fully enjoying the benefits of the decade. Among females, the proportion is highest, 22·5 per cent, between the ages 15 and 20, and is lowest 14·8, in the period 5-10. The growing interest in female education which has been perceptible during the decade under review probably explains the high proportion in the age group 15-20. Although the percentage for female literates is lowest (14·8) in the age group 5-10, it is significant that the ratio is higher than that for the male literates of the same age period, which is 13·5. This may be attributed to the circumstance that girls are sent to schools at comparatively younger ages and that, on account of lower fees charged for them, they avail themselves of the educational facilities more readily than boys.

128. Literacy by Religion.—In the marginal statement and in the diagrams facing this page, are given the percentages of literates in each main religion.

RELIGION.	LITERATES PER 100.		
	PERSONS.	MALES.	FEMALES.
Hindu . . .	26·0	37·1	14·6
Christian . . .	35·3	43·5	26·5
Musalman . . .	14·8	23·8	5·0

Of the different religious persuasions, excluding the Jews, the Jains, the Buddhists and the Zoroastrians who together form only a small minority of the entire population, the Christians bear the palm in point of literacy. Of their total number, 35·3 per hundred are literate. Among males, 43·5 per cent., and among females, 26·5 per cent., are able to read and write. The Hindus come next; but, they have only 26 literate persons for every 35 among the Christians. Taking the two sexes, 37·1 per cent of the males, and 14·6 per cent of the females, have acquired the standard. Whilst, in the proportion of literates, the Hindu males fall short of their Christian brethren only by 6·4 per cent, the Hindu females lag behind their Christian sisters by 11·9 per cent. The Musalmans come next with 14·8 literate persons in every hundred; for males the proportion is 23·8 and for females, 5·0. Although the percentage of literates among the Musalmans is small in Travancore when compared with that of the other main religionists, it has to be remembered that their ratio is very large as compared with that of the adherents of the same religion in other parts of India.

129. Literacy by caste.—Among the Hindus, as a rule, Brahmins stand at the top and Pariahs, Pulayas, etc., at the bottom. But, a good deal depends upon their profession also. Thus, among male literates, Kaniyans who form the astrologer caste have the greatest proportion (663 per mille) next to Brahmins (680, Malayala Brahmins and 720, other Brahmins). They are closely followed by Nairs (612) and then, in order, by Ambalavasis (592), Konkunis (573), Vellalas (467) and Marans (452). The other castes have each less than 450. At the other end come Kuravas, Pulayas and Pariahs. Though a mighty gulf separates these classes from the other Hindus in point of literacy, it is a noteworthy feature that, under the system of education in vogue at present, they are progressing by leaps and bounds. As against a proportion of 14, 18 and 28 per mille in 1911, their present ratio stands at 35, 40 and 109, respectively. The castes which return high proportions of literate females are the non-Malayala Brahmins (442 per mille), Marans (412), Konkunies (359), Nairs (335) and the Malayala Brahmins (323). In each of the other castes, the ratio is less than 300 per mille.

If the figures for the several Christian sects are analysed, it is observed that Europeans top the list with 966 male and 892 female literates in a thousand of each sex. Anglo-Indians follow them with a proportion of 900 males and 700 females. Among the Indian Christians, the Syrians come first with 515 and 313, followed by the other Christians.

130. Literacy in English.—In the whole of Travancore, 53,611 persons or 15 per mille of the population, 5 years of age and over, are literate in English. For

Christian.

Diagram 30.

- (4) The figures given outside the sector show the percentage of the Literates.

every 1,000 of each sex, 25 males and 6 females possess a knowledge of this language, as against 15 and 2 in the last Census. In other words, one in every 40 males and one in every 165 females are acquainted with English.

As in the case of general literacy, English education has spread mostly among the Christians, there being 34 male and 13 female literates for every 1,000 of each sex among them, as against 22 male and 3 female literates among the Hindus and 8 male and one female literates among the Musalmans. The same factors which have determined the relative positions of the followers of the several religions in respect of general literacy have operated in fixing their respective places in regard to English education also. The man who is literate in his own language is by no means necessarily acquainted also with English, but a knowledge of one tongue is, for all intents and purposes, a necessary preliminary to his being acquainted with the other. If the statistics are examined by caste, among the Hindus, the non-Malayala Brahmins top the list with 175 males and 22 females who have acquired the standard, for every 1,000 of each sex. Then comes the Konkani with 104 males and 9 females who can read and write English. The lowest proportion is found among Kuravas and Pulayas. Among the Christians, the proportions are naturally high among Europeans and Anglo-Indians, most of whom have English as their mother-tongue, and low among Indian Christians. While the first two show a proportion of 836 and 643, respectively, the last has a ratio of only 22. If the statistics for the Indian Christians are examined, it will be seen that, as against 33 males and 12 females who are literate among the Syrian Christians, there are only 29 males and 12 females who have acquired the standard among the other Christians.

Among the Administrative Divisions, the proportion is highest in the Southern Division which is the centre of higher education and where the existence of public offices, educational institutions and trading firms demand a large number of English knowing hands. In this Division, 334 males and 71 females are able to read and write English, in a ten thousand of each sex. The High Range Division which is the centre of the European Planting community comes next with a proportion of 329 male and 90 female literates. The Central and the Northern Divisions follow in order with 236 & 49 and 179 & 57, respectively.

131. Progress of Education and Comparison with Previous Censuses.—In view of the changes adopted in the definition of the term “literate” from time to time, it was thought difficult to institute an effective comparison with the results of Censuses taken prior to 1901. It was suggested, therefore, that the best plan would be to exclude from comparison persons under 15 years of age and to add to the number shown as literate in 1891 all persons over that age who were then classed as “learning.” This procedure has the serious defect of excluding from the statistics a large proportion of boys and girls of school going ages who are actually undergoing tuition. So far as this State is concerned, in the instructions given to the enumerators in 1901, the restriction was placed that a person who could read and write only a few words of a language with difficulty or who could only sign his name should not be treated as literate. Hence, the statistics for 1901 have not been vitiated by the defects which the omission to fix such a standard has produced in other parts of India. An effective comparison can therefore be instituted so far as Travancore is concerned with the statistics of at least 1901 and 1911. It will be seen from the marginal table that the proportion of literate persons has risen from 142 per mille in 1901 to 279 in 1921 or by 96 per cent. The ratio of literate males has increased by 54 per cent and that of literate females by 380 per cent. Each religion shares this increase, but it is most marked among the Hindus and least so among the Musalmans. In the age period 15-20 which includes persons who have just passed the age when reading and writing are usually learnt and which would furnish a good idea of the spread of education in the State, the proportion of male literates has risen from 264 in 1901 to 437 in 1921 or by 66 per cent. and that of female literates from 58 to 225 or by 288 per cent. As in the case of general literacy, this increase is apportioned by all the three religions, the Hindus, the Musalmans and the Christians. But, while the

percentage of increase is highest among the Hindus, *viz.*, 67 per cent for males and 289 per cent. for females, it is lowest among the Musalmans, *viz.*, 48 per cent. for males and 206 per cent. for females. Another method of gauging the progress of education in

the State is by comparing the growth of population with the growth of education. Such a comparison shows that while the population has increased by 35 per cent. (34·4 per cent. among males and 34·9 per cent. among females), the number of literates has gone up by 33·5 per cent. (110 per cent. among males and 560 per cent. among females),

during the last 20 years.

132. How far literacy once acquired is retained.—Turning to the question how far literacy once acquired is retained in Travancore, the best way of finding it out is by a comparison of the figure for literates in the age period 10-20 of the last Census with that for literates in the age group 20-30 of the present one. Such a comparison discloses that, as against 117,980 literates in the age group 10-20 in 1911, there are at present 399,412 literates in the age period 20-30. Deducting the number of deaths at the rate of 20 per mille in the literates of 1911, the number which has to be found in the age period 20-30 of the present Census is 94,390. The disproportionately large number of literates actually found in the age period 20-30 may be attributed to the circumstance that, owing to the impetus given to Vernacular Education by starting new schools and throwing them open to all castes and creeds, a very large number of boys and girls have commenced education in the State after the age of 10, but whose number could not have been included in the literacy figures of 10-20 of 1911. In addition to this, the advent of students from outside for study in the Professional Colleges here and the inaccuracies in the ages returned may also have tended to swell the number in the age group 20-30. Whatever may be the real cause for the high increase, the figures can be taken to prove that literacy once acquired is not lost in Travancore. Unlike in other parts of India, where an ordinary person hardly ever has occasion to read or write, in this State, vernacular newspapers and periodicals are so common that a man never loses the proficiency which he has once acquired in the art of reading and writing. An examination of the Journalistic activities of the State shows that the number of newspapers and periodicals published in 1921 was 92, with a circulation of 82,246, against 45 and 34,890, respectively, in 1911. The number of private letters transmitted through the Anchal alone, amounting to 98 lakhs in 1921 against 47 in 1901, indicate the extent of education and the use made of it in retaining and improving literacy once acquired in the state.

133. Statistics of the Education Department.—The total number of scholars in all kinds of educational institutions, departmental and non-departmental, in 1901, was 184,639. In 1911, the number went down, to 159,913,

owing to the strict enforcement of the provisions of the Education Code of the State. In 1921, the number of scholars again rose to 427,723. According to the Administration Report of the Education Department, 71·2 per cent. of the children of school going age were at school in 1921. This high proportion is the result of having taken 15 per cent. of the total population of the State as the school going population. As this percentage embraces only the number of persons between the ages 5 and 11, and, as school going population includes all persons undergoing primary, secondary and collegiate education, the total of the persons falling within the age limits 5 and 25 should be regarded as school going population, for all practical purposes. It will be seen from Imperial Table VIII that the number of persons between 5 and 25 years of age is 1,811,706 or 45 per cent. of the total population. Thus, the number of scholars attending schools in 1921, *viz.*, 427,723, will bear only a proportion of 23·6 per cent. to the school-going population of the State.

CHAPTER IX.

LANGUAGE.

134. Reference to Statistics.—The statistics made use of in this Chapter are found in Imperial Tables VIII, IX and X and in the following Subsidiary Tables :—

Subsidiary Table I. Distribution of total population by Language according to Census.

II. Distribution by Language of the population of each Division, showing only the more important Languages.

135. Nature and Scope of the Return.—The instructions given this time to the enumerators were the same as those in the last Census. In the case of infants and deaf-mutes, the language of the mother was required to be noted. Whatever may be the object of this instruction in other parts of India, its importance, as far as this State is concerned, is obvious. In other parts of India, marriages generally take place between persons speaking the same language, whereas, in this State, as the *Sambantham* form of marriage between different castes is recognised, the contracting parties do not always speak the same language, and, in consequence, the language of the mother may not invariably be the same as that of the father. Another peculiarity observed here is that certain classes of persons, for instance Tamil Brahmins, do not know to read and write their mother tongue, Tamil, while they can read and write Malayalam, the language of the State. Under the above circumstances, the correspondence observed else-where between literacy, language and caste, cannot be expected in this State.

136. Languages spoken and their Classification.—The total number of languages spoken by the persons enumerated in the State is 28. From the classification of the languages, as per Grierson's Scheme, given in Subsidiary Table I, it will be seen that the languages spoken are almost entirely of the Dravidian family and that the persons who speak those languages number 995 out of every 1,000 of the population. Of the remaining 5 persons, 4 are appropriated by the Sanskrit sub-branch of the Indo-European family and one by all other languages together.

137. Dravidian Family-Malayalam.—Malayalam is the language of the State and the mother tongue of about 84 per cent. of the population. It is considered to be an off-shoot of Tamil with a large infusion of Sanskrit words. It is not therefore difficult for persons speaking Tamil with Sanskrit words admixed, such as Tamil Brahmins, to understand Malayalam, while, the reverse is not always the case. The proportion of the population, speaking this language is highest in the Northern Division, 9,771 per 10,000 of the population, and lowest in the High Range Division, 2,419. The Central Division with 9,442 comes next to the Northern, followed by the Southern Division with 5,674. The literary activities in the field of Malayalam, displayed during the decade, can be gauged from the number of books, newspapers and periodicals published in that language. The number of books published in 1921 was 164, against 111 in 1911. The number of newspapers and periodicals published and their circulation in 1921 were 72 and 70,000 against 33 and 27,000 in 1911. The literacy in this language has increased by 92 per cent. in the decade against 40 in the last. There is one point, however, which should not be allowed to escape notice. Though, in the matter of general literacy, the Nairs show increased proportions in the last two censuses, as compared with Vellalas, in point of English literacy, their proportion is considerably less than that of the latter. Both in the matter of general and English Literacy, the Vellalas of this State are ahead of those in the Province of Madras. It has been observed that people who have to speak one language in their homes and another in the village are more apt to make an effort to learn the common language, as English here, and are in fact tri-lingual. The fact observed among the Vellalas of this State goes to support this observation.

138. Tamil.—Next to Malayalam, Tamil is largely spoken in the State, and as many as 16 per cent. of the population converse in this language. There is not much of literary activity in the State in the field of Tamil. The number of books published in 1921 was 6 against 10 in 1911. The number of newspapers and periodicals published and their circulation in 1921, were 7 & 7,050 against 4 & 1750, respectively, in 1,911. Literacy in Tamil has increased by 5 per cent. during the decade, against 11 in the last. Of the 624,917 persons whose mother tongue is Tamil, 398,922 were enumerated in the Sea-Coast Division, 208,098 in the Mountainous Division and 17,897 in the Inland Division. It is spoken by 7,130 persons out of every 10,000 in the High Range Division, by 4,250 in the Southern Division and by 490 and 153 in the Central and the Northern Divisions, respectively. The high proportion observed in the High Range Division is due to the fact that the coolie population working in the estates there is mostly from the Tamil districts outside Travancore.

139. Telugu, Tulu and Canarese.—Telugu, Tulu and Canarese complete the list of the Dravidian languages spoken in the State. Telugu is spoken by 16, Tulu by 5 and Canarese by 2 in every 10,000 of the population.

140. Other Languages.—Of the other languages, Konkani, Hindostani Marathi, English and Patnuli are the mother tongues of 23, 7, 7, 5 and 3, respectively, per 10,000 of the population. It has to be remembered that, though English is the mother tongue of only 5 for every 10,000 of the people the number of persons who are literate in that language is considerably large in this State.

CHAPTER X.

INFIRMITIES.

141. Opening Remarks.—This is the most unsatisfactory and the least important subject dealt with in a Census Report. Successive Census Commissioners in England from 1881 upwards have condemned the subject as useless and the figures as not worth the cost of collection and tabulation. The Royal Commission on the Care and Control of the Feeble minded in England is also of the same opinion. In other European countries too, similar opinion prevails; and, in the United States of America, the subject has been left out of the Census Operations since the eleventh Census. The information collected is useful neither from a scientific nor administrative point of view, and it does not appear to have served any useful purpose till now. People generally resent being interrogated about the existence of infirmities among the members of their houses; and the nature of the infirmities is such as not to admit of their being correctly diagnosed by lay men. Enquiries in connection with infirmities not only fail to collect correct information about them, but, on account of the resentment they provoke, result in the loss of co-operation between the enumerators and the enumerated and prejudicially interfere with the correct response to the queries on other points of the schedule. It is therefore time to consider whether “the serious proposal” to drop this enquiry altogether, cannot be carried out.

142. Reference to Tables.—Imperial Tables XII and XII-A and the following Subsidiary Tables refer to the statistics on the subject.

- Subsidiary Table I. Number afflicted per 100,000 of the population at each of the last 5 Censuses.
- II. Distribution of the Infirm by Age per 10,000 of each Sex.
- III. Number afflicted per 100,000 persons of each age period and number of females afflicted per 1,000 males.

143. Relative Prevalence of the Infirmities.—To the number of infirmities required to be enquired into, is added in this State “Elephantiasis” which largely prevails in the Sea-Coast tracts, in the northern parts of the State. The statement given in the margin shows the number of persons afflicted with each of the 5 infirmities, in the last 4 Censuses. If Elephantiasis is excluded, Deaf-Mutism shows

NUMBER OF PERSONS UNDER EACH INFIRMITY
IN THE LAST 4 CENSUSES.

	1921	1911	1901	1891
Insane	1,271	628	503	394
Deaf-Mutes	2,169	993	809	745
Blind	1,680	1,217	1,043	1,017
Lepers	2,058	1,115	1,414	968
Elephantiasis	11 637	4,217	5,924	Not taken.

the largest number in 1921 and occupies the first place, while it took the third in the three previous Censuses. This is attributable to the withdrawal of the limitation “from birth” from the instructions “deaf and dumb from birth” given in the last Census. Insanity occupies the last place, as in all the previous Censuses. A gradual increase is seen in all the infirmities, though Leprosy and Elephantiasis show a fall in 1911. The increase in the numbers returned this time is partly accounted for, by the spread of the infirmities and partly by the increased accuracy in the enumeration. As has been already pointed out, the number of enumerators employed this time was more than seven times that in the previous Census, and, as most of the enumerators who were school masters, were posted for duty either in or near the places where they lived or where their schools were situated, the pupils in those places would have rendered them help in obtaining accurate information about the infirmities among their households and in the neighbourhood, which, it is not possible to get, otherwise.

144. Insanity—Accuracy of the Return.—Of all the diseases from which human beings suffer, insanity is the most difficult for diagnosis, which could

only be made, after close observation extending over a number of days, by psychiatrists. The line separating sane from insane is very thin and imperceptible and varies with the mentality of the person making the diagnosis. While such is the case, the diagnosis made either by the enumerators or other persons having no knowledge of even normal psychology, cannot be expected to be correct.

145. Causes.—Various causes have been given as contributing towards the onset of this malady, Racial, Social and Climatic. But, none of them has been considered to be satisfactory. There is one point however which is noticeable and suggestive. The incidence of the affliction is more in countries where industry and commerce have developed than in India where agriculture is the chief occupation of the people. The reason is obvious. Agriculture, as is obtaining in India, chiefly depends upon the monsoons, and, if they are favourable and timely, the harvest is good and plenty, but, if they fail, there is failure of crops. This is too well known to every agriculturist; and it is only very rarely that one is affected seriously by the failure of crops. In the case of industry and commerce, where there is much of speculation and the results are unforeseen, the failure, causing in some cases utter ruin, is productive of mental aberration. The gradual increase observed in this disease in the State, from census to census, not only indicates that greater care is being bestowed in the enumeration, but also, in a way, suggests that the people are becoming industrial. The prevalence of the ailment more among the Christians than among the Hindus, would suggest that religion also has a share in the causation of the disease. The common people among the Hindus believe that human beings are not completely responsible for their acts, that they are only tools in the hands of the Supreme Being, and that everything good or bad happens as previously destined; and they resign themselves to what is called Fate, with the result that they are not as much affected by calamity or misfortune as the followers of the other religions. This may account in a way for the lower incidence of the disease among them.

146. Variation.—In the diagram given in the margin, is shown the variation in number between the last and this Census, in each sex and in the several age periods.

DIAGRAM 31 SHOWING THE NUMBER OF PERSONS AFFLICTED, PER 100,000, LIVING AT EACH AGE PERIOD.

The number afflicted has risen from 628 in 1911 to 1,271 in 1921, or by 102 per cent., males by 113 per cent. and females by 89 per cent. The proportion of the persons afflicted, per 100,000 of the total population, is 31 against 18 in 1911. The ratio which the number afflicted with insanity bears to the total of all the 4 infirmities,

is 18 per cent, against 16 in 1911.

147. Distribution by Age, Sex, Religion and Caste.—The proportion of the females afflicted is less than that of males, unlike in England and Wales, where their ratio is more. The reason for the difference between the two countries in this

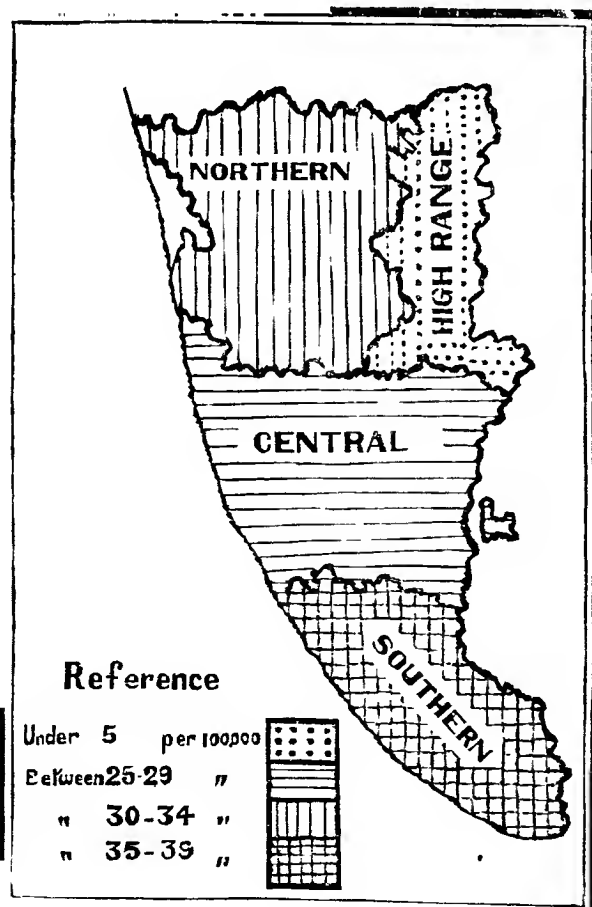

matter is simple. Females in India, in a vast majority of cases, limit their activities to household duties and the wear and tear of their nervous system is considerably less than that of males. Among males, the large increase observed in the age period 10-20 may be due to the mental strain caused by education, in 20-30 to marriages

Veluthedan	71
Pathan	71

with their responsibilities and worry, and, in 50-60, to the advent of senility. Among females, the increase between the ages 10 and 20 is the result of education and puberty, in the ages 40 to 50, of the climacteric changes, and, in 50-60, of dotage. The comparatively low incidence of the infirmity in the age period 20-40, when insanity of pregnancy, lactation and puerperium should be very common, is noteworthy and does not admit of correct explanation. Taking the several religions, the disease is most prevalent among the Christians among whom the proportion is 40 per 100,000, and least so among the Musalmans, the proportion among them being 23 per 100,000, while the Hindus and the Animists come in the middle with 29 and 24 respectively in every 100,000 of each. As stated above, religion has a share in the causation of the infirmity. The spread of education among the Christians, more than among other religionists, is an additional cause. The main castes among whom the proportion affected is twice the average for the State or more and the rate of affliction for every 100,000 of them are given in the margin. The Elavaniyan, Kudumi, Marakkan, Maravan, Pallan and Vedan among Hindus, and Labbai among Musalmans, are free from the infirmity.

11. **148. Local Distribution.**—The map given in the margin shows the distribution of the insane for every 100,000 of the population, among the several Administrative Divisions of the State. It is seen that the disease is most prevalent in the Northern Division * 31 per 100,000, and least in the High Range, 5 per 100,000. In the other Divisions, it is equally distributed *viz.*, 29 in 100,000. As the High Range Division is chiefly inhabited by business men and coolies who have immigrated from outside, there is no place for insane persons there. The high rate obtaining in the Northern Division is significant, as deaf-mutism which is closely connected with insanity, also prevails very largely here. The majority of the Christians live in this Division, and people here resort more to industrial and commercial

MAP 4. SHOWING THE PREVALENCE OF INFIRMITY IN THE SEVERAL ADMINISTRATIVE DIVISIONS OF THE STATE.

* If the number of Lunatics admitted from the Northern Division into the Lunatic Asylum at Trivandrum and shown in the number for the Southern Division be taken away from the latter and added to the number for the former, the percentage will be the highest for the Northern Division.

pursuits than to agriculture. These factors perhaps account for the increased prevalence of the malady in the Division.

149. Lunatic Asylum and Lunacy Act.—There is in this State only one asylum, a Government institution, in which the number enumerated was 146 (108 males and 38 females). The Lunacy Act passed in 1904 making provision for the detention and treatment of the lunatics continues to be in operation.

150. Deaf-Mutism-Nature of the Return, Causes and Variation.—In 1911, special instructions were issued to the effect that only persons who had been deaf and dumb from birth should be entered as having been afflicted with the infirmity. This time, the qualification "from birth" was taken away. The result is

DIAGRAM 32 SHOWING THE NUMBER OF PERSONS AFFLICTED PER 100,000 LIVING AT EACH AGE PERIOD.

that a large number of persons who have become deaf or dumb subsequent to birth have been returned as deaf-mutes. The cause of this ailment is still obscure. It is observed that this infirmity co-exists with goitre; and it is believed that the latter is caused by deficiency of iodine in the food. The same cause may contribute towards the onset of deaf-mutism. As iodine is taken in with the sea-salt in which the required quantity of it is contained, any deficiency in the quantity or change in the quality of the salt taken, may cause the disease. As the sea-salt in mountainous countries is costly and as in some cases rock-salt which is deficient in iodine is used, the prevalence of the affliction in mountainous tracts may be explained. The increase in the proportion amounting to 118 per cent. (males 120 and females 117), over that of the last census must be attributed partly to the withdrawal of specific instructions and partly to the general increase observed in all the infirmities.

The diagram given in the margin shows the variation in the proportion of the incidence of the infirmity in each sex and in several age periods between 1911 and 1921.

151. Distribution by Age, Sex, Religion and Caste.—As in the case of insanity, the number of females afflicted with deaf-mutism is less than that of

Velan	109

males. Being a congenital disease, it cannot be expected that persons suffering from it would live long. The number in the earlier age periods should therefore be more than that in the later ones, unlike in the case of mere deafness which increases with the age. The existence, therefore, of a large number of cases in the later age periods is an indication that mere deafness has been included in the return. The Hindus and the Musalmans have been afflicted more than any other religionists. The castes among the Hindus that have a greater proportion than the State average are given in the margin. Malayala Kshatriyas and Sakkilians among the Hindus are free

from this infirmity.

152. Local Distribution.—The inset map shows the prevalence of the

MAP 5. SHOWING THE PREVALENCE OF INFIRMITY
IN THE SEVERAL ADMINISTRATIVE DIVISIONS
OF THE STATE.

infirmity in the several Administrative Divisions of the State. It is seen that, as in the case of insanity with which it is closely associated, deaf-mutism prevails most in the Northern Division, 67 per 100,000, and least in the High Range Division, 31.

153. Blindness—Correctness of the Return, Causes and Variations.—The instructions given for the return of this infirmity were, as in the previous Censuses, simple and intelligible, and the figures collected may therefore be taken as accurate. The increase in this affliction, unlike in others, is only 38 per cent. That the rise in the females in this disease is more than that in the males, while, in all the other infirmities and in the total including this, the males are more afflicted than the females, is note-worthy. The causes are various and among others, are given ill-ventilated houses, dry and windy climate and want of attention to the eyes immediately after birth. But education involving reading and writing is casually mentioned as a cause in the Census Reports of other countries. Whatever may be the reason for the

infirmity in the other parts of India, education imparted in schools under the conditions

DIAGRAM 33 SHOWING THE NUMBER OF PERSONS AFFLICTED PER 100,000 AT EACH AGE PERIOD.

obtaining in this State, is a potent factor in the causation of the affliction. The pupils live in scattered villages and detached home-steads and attend schools 3 or 4 miles away from their homes. Most of them take their morning *conjee* at about 8 and leave their houses for schools. In the noon, the majority of them starve, and the rest either take coffee, tea or cakes, purchased from the neighbouring bazaars, or partake of the meals brought by them. In the evening, they walk home, and after bathing, take substantial meals in the night. Mere walking on even roads without ups and downs, for 7 or 8 miles a day, at the rate of 3 miles an hour, is considered to be a sufficient exercise for a fully developed per-

son weighing 150 lbs. For immature and growing children of school going age, such walking is more than what is good, and the starvation all the day, with drill and gymnastics as physical exercises in addition, are harmful, and cause debility. The first effect of debility falls on vision. Along with this, if there be any predisposition to weakness of eyes, and, with the strain involved in reading and writing, the onset of the malady is sure and certain.

154. Distribution by Age, Sex, Religion and Caste.—Though there has been an increase of 38 per cent on the whole, the increase in children under 10 is only 18 per cent. This indicates the care bestowed on infants during and after birth. In the school going age 10-20, the increase is very high, 54 per cent, which establishes the correlation between education and failure of vision as cause and effect and the necessity of medical inspection of students. In the age period 20-40, the period of active life, the increase is 27 per cent, which is below the State average, while, in old age, the increase is 45 per cent. The males have fared better in the decade than the females, and the percentage of increase among them, is only 36 against 38 on the whole. Boys under 10 and persons of school going age, 10-20, have been affected more than others, their percentages being 30 and 53, respectively. Females have suffered severely in this decade, their increase being 40 per cent. Girls under 10 are the least afflicted, and their increase is only 2 per cent, while those between 10 and 20 have suffered most, the increase being 56 per cent. As education

has advanced very much among females, the large increase in the number afflicted in the school going age 10-20 is explicable. Between 20 and 40, the increase is 38 per cent among females against 21 among males. The greater increase among females must be attributed to child birth and the complications incidental to it which are said to cause blindness in some cases. Old ladies have fared equally with old gentlemen. The Hindus are the worst sufferers, 43 per 100,000 followed by the Christians and the Musalmans with 40 each. According to the return, there is no blindness among the Animists.

NAME OF CASTE.	PROPORTION PER 100,000 AFFLICTED.

In the margin is shown the castes afflicted with this infirmity having a proportion higher than the State average. Except the Sakkiliyan among the Hindus and Labbai among the Musalmans, all are afflicted. The Anglo-Indians and the Animists are free from the infirmity.

155. Local Distribution.—The map given at the side shows the

MAP 6. SHOWING THE PREVALENCE OF THE INFIRMITY IN THE SEVERAL ADMINISTRATIVE DIVISIONS OF THE STATE

distribution of the infirmity in the several Administrative Divisions of the State. It is most prevalent in the Northern Division where the proportion is 58 for every 100,000. Then comes the Central Division with 37, followed by the Southern with 32. Lastly comes the High Range with 11. In the Northern Division, the increased prevalence is due to the predominance of the Christians, among whom education has spread largely, while, in the High Range Division, the

incidence is the lowest as the inhabitants are mostly illiterate immigrant coolies.

156. Ophthalmic Hospital.—There are two Ophthalmic Hospitals in the State, one owned by Government in Trivandrum and the other maintained by the Salvation Army at Nagercoil. The number of operations successfully performed for cataract and other diseases affecting sight during the last decade was 3,171 in the former and 906 in the latter.

157. Leprosy.—The Scope of the Return, Causes and Variations.

DIAGRAM 34 SHOWING THE NUMBER OF PERSONS AFFLICTED PER 1,00,000 AT EACH AGE PERIOD:

Next to insanity, leprosy is the most difficult infirmity for differential diagnosis. Though instructions were issued in this Census as in previous Censuses, not to return mere white spots under this infirmity, it is extremely doubtful if the instructions had been correctly followed. In the Vernacular of the State, Lucoderma-white spots-is also called a variety of leprosy. The causes are still obscure, the fish theory advocated by Dr. Hutchinson having been found to be incorrect. The prevalence of this ailment along with Elephantiasis would suggest that the carriers of the

infection of both the diseases may be one and the same. The number of persons afflicted with this disease has increased from 1,115 in 1911 to 2,058 in 1921 or by 85 per cent. The diagram in the margin shows the variation in number between this and the last Census.

158. Distribution by Age, Sex, Religion and Caste.—The affliction

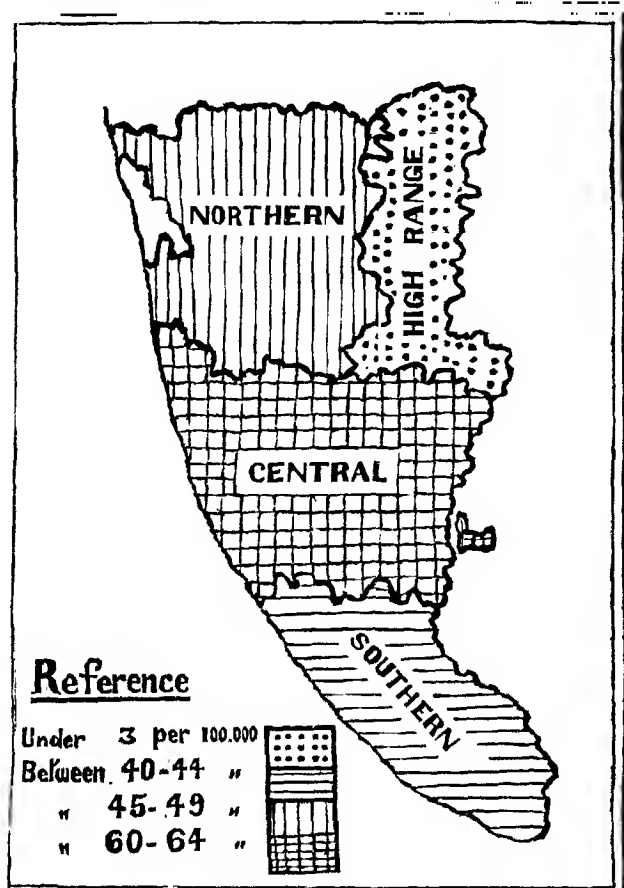

NAME OF CASTE.	PROPORTION PER 100,000 AFFLICTED.
Chekkala	103
Marakkan	166
Saliyan	118
Veluthedan	142
Pathan	143

increases gradually, as the age advances, until the 60th year when it falls a little. The increase, observed during the decade is largest among children under 10, amounting to 133 per cent, followed by persons of the next decennial age period, with 119 per cent. In the next age group 20-40, the increase falls to 78 per cent., and then rises again to 83 per cent. in old age. Females are less afflicted than males: and the difference in the incidence between them, *viz.*, 73 per 100,000 among males and 29, among females must be attributed to omission. The Hindus return the largest proportions, 59, followed by the Animists, with

40, the Christians with 39 and lastly the Musalmans with 35. The very small proportion of females afflicted among Musalmans, 12 per 100,000, is evidently due to omission on account of the observance of purdah system among them. The castes free from this infirmity are the Elavaniyans, Malayala Kshatriyas, Pallans, Sakkiliyars and Malavedans among the Hindus and the Animists and the Mughals among the Musalmans. The castes having proportions more than the State average are given in the inset.

159. Local Distribution.—The side map shows the distribution of

MAP 7. SHOWING THE PREVALENCE OF THE INFIRMITY IN THE SEVERAL ADMINISTRATIVE DIVISIONS OF THE STATE.

the infirmity in the several Divisions of the State. It prevails largely in the Central Division, 62 per 100,000 which is followed by the Northern Division with 48, the Southern Division with 43, and lastly the High Range Division with 3.

160. Leper Asylums and Leper Regulation.—The Leper Act III of 1079 extends to all Municipal and Police towns of the State. There are 3 Leper Asylums, one in Trivandrum, maintained by Government and the other two in Alleppey and Eraniel, maintained by Missionary bodies. The total number enumerated in these Asylums was 215 (males 173 and females 42).

161. Elephantiasis—The Nature of the Return, Causes and Variations.—This infirmity extensively prevails in the northern coast taluks of the State and is only a manifestation of the primary disease Filariasis, caused by the presence of *Filaria* in the system. As, without microscopical examination of the blood, it is not always possible to say whether any swelling is elephantoid or not, the figures shown under this infirmity cannot be expected to be correct. The number returned in this Census, viz., 11,637, and the increase of 176 per cent. observed, do not in any way indicate the extent of the prevalence or the rate of spread of the disease, as the number itself falls short of that found actually in a single taluk. Wherever the land is low and the soil permits of stagnation of water, affording convenient breeding ground for a particular species of mosquitoes, there the disease is found, and such places exist in the State mostly along the Sea-Coast in the north.

162. Distribution by Age, Sex, Religion and Caste.—In the last Census, no one under 5 years was returned as afflicted; while, this time, 37 children (17 males and 20 females) are returned. This is hardly believable, as 5 years is

too short a period for the infection to enter into the system and develop the characteristic swellings. Taking the several age periods, it is seen that the percentages of increase is 669, 157, 137 and 209 in the age periods 0-10, 10-20, 20-40 and 40 and above, respectively. The smaller number returned among females is evidently due to omission. It is prevalent more among the Hindus 339 per 10,000 than other religionists. The Musalmans come next 267 followed by the Christians 193. The Animists are practically free from the infirmity. In the last Census, the Christians followed the Hindus and this time the Christians and the Musalmans

have interchanged their places. Except the Krishnavakai, Konkani, Pallan, and Sakkiliyan among the Hindus, all other castes are affected. The Anglo-Indians are free from this disease. The castes having proportions more than the State average are given in the inset.

NAME OF CASTE.	PROPORTION PER 100,000 AFFLICTED.
Arayan . . .	1,356
Izhavan . . .	744
Saliyan . . .	1,022
Válan . . .	648
Velan . . .	1,769
Veluthedan . . .	665

163. Local Distribution.—The Map given in the margin shows the prevalence of the infirmity in the several Natural Divisions of the State. It is seen that the ailment prevails largely in the Sea-Coast Division where facilities for mosquitoes to breed are more than in other parts. In the Mountainous Division, on account of the absence of those facilities, the disease is seen to be least prevalent. As this infirmity is found in places where leprosy also prevails, it is not unlikely that the carriers of the infection of both the diseases may be one and the same. In the Sea-Coast Division, the proportions of the incidence of both the infirmities stand high, leprosy with 61 persons in every 100,000 and Elephantiasis, with

536 persons.

CHAPTER XI.

CASTE, TRIBE, RACE OR NATIONALITY.

164. General—Utility of the Return.—Whatever may be the opinion about the reasons in general, brought forward by the Hon'ble Member in the Legislative Assembly, for discontinuing the classification of the Hindu population into castes and the subsequent discussion on the subject, there can be no doubt about the general inaccuracy of the figures, as many members of a comparatively low caste try to pass themselves off as belonging to a higher one, and the fact that the Census acts as an exciting cause for feuds between castes. In the preliminary enumeration, the Chanars in this State returned their caste as such and their occupation as toddy drawing. But, as after the preliminary enumeration of this State was over, permission was granted to the Chanars in the Province of Madras to change their caste name into Nadar Kshatriyas, they wanted here to have in the final Census their caste name changed similarly and their occupation altered into agriculture. As the final Census consists only in the checking of the preliminary enumeration figures, the change was not effected. It is extremely doubtful whether, for the trouble taken in collecting the information and tabulating the figures, corresponding benefit is derived. If the classification of castes by social precedence is out of the question, their classification by traditional occupation is equally so, when the Izhavas have in public meetings solemnly disclaimed all connection with toddy drawing which has been their traditional occupation till now. The best method of solving this difficult problem of classification is to discontinue it altogether.

165. Race and Tribe.—If the few Aryans, Iranians, etc., are excluded, there is practically only one race in this state, *viz.*, the Dravidian Race. This race has two tribes, the Malayalee and the non-Malayalee. They differ from each other not only in respect of law of inheritance and system of marriage, but also as regards their habits, dress, etc. Statistics have, therefore, been collected separately for them in order that their demography may be studied.

166. Socio-Political Unrest and its Results in the Caste System.—In the universal unrest that characterised the decade under review, the Socio-Political question has had a large share. In Southern India, it took the form of agitation for communal representation in public bodies, institutions and services, and this State has not been completely free from it. The results of such agitation were observed not only in the figures returned in the schedules but also in tabulation, where attempts to put non-Malayala Chettys under Malayalees were detected and corrected. The cause for the marked variation noticed in the strength of the several castes has to a large extent to be traced to the same source.

167. Multiplication and Classification of Hindu Castes.—The total number of Hindu castes returned in the last Census was 166. In this Census, their number has increased to 193, excluding the 35 castes grouped under "Ambalavasi", "Brahmin" and "Kammalan." While 29 of the castes returned in the last Census were not represented this time, 95 new castes have come in their place. The classification of castes among the Hindus, particularly among the Malayalees, is somewhat artificial and loose. One and the same caste is called by different names in different localities and by different persons. Thus, barbers are called "Amjattan" in one place "Kshavarakan" in another and "Nasuvan" in a third. Kuruppu is given as a sub-division of Asari, Izhavan, Kaniyan, Maran and Nair; Illam, as a sub-division of Chanan, Izhavan, Maran, Nair and Pulluvan; Swaropam, of Nair, Maran and Itayan and Daivampady, of Nair and Ambalavasi. In these circumstances, the variation in the number of the several castes of the Hindus cannot be natural but should be the result of artificial inflation or depletion. However, attempt has been made, as far as the main castes are concerned, to ascertain their correct number and variations and explain them.

168. The Untouchable and the Depressed Classes.—The question of untouchability and the elevation of the depressed classes loomed largely in practical politics, during the decade, throughout India, and this State has not fallen behind it in that respect. The tendency of the time and the change of habits of the people in the matter of living and eating have, in a way, lessened the rigour of the caste system. In towns, where private scavenging and sweeping are enforced, the scavengers and sweepers have not only to go near the houses but have sometimes to enter into them for scavenging. This has done away with distance-pollution. The Government have taken steps to improve the condition of these classes. Facilities for education are afforded by exempting them from payment of fees ; and all Government Chattrams and Schools are thrown open to them. Preference is given them in the matter of registration of waste lands ; and competent men among them are nominated as members of the representative institutions of the State.

169. Mongolian Patch.—The Medical Officers in charge of the Government Medical Institutions in the State were required to note, in cases of births attended by them within or outside their institutions, the existence, if any, of Mongolian patches, on the infants born, and a description of the patches was also supplied to them for information. In my circuits, I found that some of the Medical Officers had not understood the subject, and that others had not bestowed any care or trouble in collecting the information. In 15 cases, the existence of the patch was noted. But, on my explaining to them the nature of the patch and how and where they were to be looked for, they said they had seen them in several cases. In a large number of births that have come to my knowledge, I have seen the patch, and I am inclined to think, therefore, that it occurs in a large number of infants. It is generally believed among mothers that the non-existence of the patch is an indication that the child is fair and that its existence is a sign that the child is not fair though it may appear so at birth.

170. Reference to Statistics.—In the discussion of the subject dealt with in this Chapter the figures contained in the following Tables are used :—

Imperial Table XIII. Caste, Tribe, Race or Nationality.

XVI. Europeans and Allied Races and Anglo-Indians by Race and Age.

Subsidiary Table I. Castes classified according to their traditional occupations.

II. Variations in Caste, Tribe and Race since 1911.

171. Hindu Castes.—In the matter of tabulation of Castes, the instruction issued by the Census Commissioner for India that the castes whose number falls short of one per mille of the population, should be omitted, was strictly followed, except in the case of the Malayala Kshatriyas. In the last Census, Ambalavasi, Brahmin and Kammalan were shown in Tables IX and XIV as main castes and the figures given against them included those of the sub castes forming them. But in Tables XIII and XVI each sub caste was shown separately. This time those main castes were shown in all the Tables and the particulars of the sub-castes which go to form each main caste were given in the title page of Table XIII.

172. Variations in the Chief Castes—Nairs.—Nairs who form the most important of the several Hindu castes of the State number 690,495 showing an increase of 16·5 per cent. over the figure of last Census. Under the conditions obtaining among them, this increase which is 5·2 per cent. higher than that for all the Hindus put together, can hardly be believed. Of all the castes, the Nairs have the largest number of sub-divisions, viz., 116. The sub-divisions and the figures for each were given in 1901. As under the rules followed in the last and in this census, the castes, as given by the enumerated, had to be noted, those who had given 'Nair' as their caste were returned as such, and no enquiry was made as to the particular sub-division of the caste to which he or she belonged. For reasons given in para 167,

persons of other castes also seem to have been included under Nairs. What these castes and their numbers are can be ascertained by looking at the figures of other castes for big rents and they were actually seen to exist in Maran, Chakkalan, Krishnavaka and Chetty castes. It is quite possible that Marans who have been included among Ambalavasis in Cochin, would have at least returned themselves as Nairs here. The Chakkalas who have been agitating for their being treated as Nairs, may have taken the opportunity of the Census to satisfy their wish. Some of the Krishnavaka who follow Marumakkathayam law are likely to have returned themselves as Nairs and, as stated in para 166, some of the Chettys also may have been included among them. Besides these castes, there are several minor castes which show a decrease in their numbers. It is not unlikely that some of them have also contributed their quota to swell the number of the Nairs. If the natural increase of the above four castes at the rate of 11·3 per cent. observed in the case of the Hindus in general, be calculated and deducted from the number returned under Nairs, their rate of increase would go down to 9·9 per cent. which, as is seen from other sources, is the normal increase for them under existing conditions.

173. Izhavas.—The Izhavas come next with a population of 667,935 and show an increase of 22·3 per cent. over the last Census figure. The increase is about twice the average for the Hindus. The Izhavas are a sturdy class; and female education and restriction to marriages do not obtain as much among them as in Nairs. An increase of about 16·8 per cent., which is the average for the State, can therefore be naturally expected among them. And for the further increase of 5·5 per cent., no explanation can be given, except that the increase of 11 per cent. found in the last Census was the result of under-enumeration and that the omission has been supplied this time.

174. Chanan (Shanars).—They are also called Nadars. They wanted to be returned as Nadar Kshatriyas. They number 200,838 and occupy the third rank, as regards numerical strength, among the Hindus. They have increased by 20·8 per cent. in this Census. The increase of 0·9 per cent. shown in the last Census is unbelievably low and must be attributed to under-enumeration. The large increase observed this time is, therefore, due to the supply of omissions of the last Census and the natural increase during the decade.

175. Pulayan.—There was a decrease of over 10 per cent. among the Pulayas in 1911 as compared with 1901, and this time an increase of 6 per cent. is observed. The small increase may be the result of their conversion to Christianity.

176. Other Castes showing increase in their strength.—Among the other castes which show increase in their strength, Sakkiliyan comes first, with an increase of 104 per cent. Even in 1911, this caste showed an increase of 74 per cent. That this abnormal increase is not natural goes without saying. The high demand for their labour caused by the increase in the number of persons using leather goods, might have induced other castes to take up their profession and return themselves as Sakkiliyans. Pallans come next, with an increase of 42·6 per cent. against 31·8 in 1911. The chances are that some of the Pariahs, who show a decrease this time, have returned themselves under this caste. Malayala Brahmins have increased by 41·8 per cent. while their rise in 1911 was 8·9. Among Muthathus and Elayathus, decrease is observed. It is not unlikely that some of them have been returned as Brahmins and that some of the Other-Brahmins whose increase is only 1·1 percent have been wrongly included under Malayala Brahmins.

177. Castes whose Strength has decreased in the decade.—The decrease observed among Maran (60·5 per cent.) Chakkalan (45·8 per cent.) Krishnavaka (7·1 per cent.) and Chetty (16·5 per cent.) have already been accounted for. As regards the decrease noticed among Malayala Kzhatriya (42·4), Ambalavasi (8·1), Konkani (45·5) and Ilavaniyan (23·7), it may be stated that it is as unreliable as

the increase found among them in 1911, *viz.*, 83 per cent. in Malayala Kzhatriya, 70·4 in Ambalavasi, 154·6 in Konkani and 56·9 in Ilavaniyan.

178. Animists.—In the last Census, “Vedan” was not found among the Hindus. Evidently they were included under “Malavedan” among the Animists. This time, as some of the Vedans were enumerated in the plains, they were classed under the Hindus. The Animists are quite ignorant of and unconcerned with their religion and how they are classed in the Census. Their religion is determined chiefly by the Census Officers

179. Musalmans.—In the last Census, the Musalman population was returned under 44 castes and this time their number has decreased by 8. Seventeen castes of the last Census have not been returned this time while in their place 9 new castes have come into existence. The abnormal increase observed among Mughal and Ravuthan is evidently due to inaccurate enumeration.

180. Christians.—In addition to the 20 sects and 185 sub-sects into which the Christians are divided, two new sub-sects, Aiyanavar Christians and Sambavar Christians have come into existence. They are converts from Aiyanavar and Sambavar Hindus and call themselves so to distinguish them from converts from other castes and religions.

181. Europeans and Anglo-Indians.—Taking Europeans, the largest number of them was enumerated in the Central Division (161), followed by the High Range with 114, the Southern with 106 and the Northern with 8. The Central Division contains the largest number of Anglo-Indians 2,019 followed by the Southern Division with 1,453 and the Northern Division with 259. The High Range Division comes last with 80.

SUBSIDIARY TABLE I.—*Hindu and Animist castes classified according to their traditional occupation.*

Group and caste.	Strength.	Group and caste.	Strength.	Group and caste.	Strength.
I. Agriculturists.	779,143

				European	389	399	— 2.5
				Indian Christian	1,168,724	901,719	+ 29.6

The figures given for 1911 represent the figures for all Sub-Castes included under the main Caste, viz. *Ampalavasi*:—Ampalavasi, Atikal, Chakkiliyar, Daivampati, Kurukkal, Nampiti, Nampiyar, Pilappalli, Pisharati, Pushpakani, Puduvai, Tiyyattuoni & Variar. *Idayan*:—Kannadiyan, Kaundan, Konan, and Itayan. *Brahmin others*:—Gauda, Kanarese, Maharatta, Tamil, Telugu, Tulu, Ari, and Aryapatr. *Kammalan*:—Asari, Kallasari, Kammalan, Kannan, Kollan, Tattan, Chemputhatty, Silpasari, Vālan, Vilkurupu and Chayakuruppu. *Mannan*:—Mannan and Patyan. *Maravan*:—Maravan and Talavan. *Sakkiliyan*:—Chemman and Sakkiliyan. *Velān*:—Kusavan and Velau. *Veluthedan*:—Vannan and Veluthedan.

GLOSSARY OF RECOGNISABLE CASTES.

(Table XIII Hindus and Animists.)

A.

Akamutayan.—A cultivating caste found in the Tamil districts of the Madras Presidency.

Alavan.—Also called Uppalavans, because they work in *Alams* or salt-pans. They constitute the salt-manufacturing caste.

Ampalavasi.—Literally one who lives in a temple, a generic name applied to castes whose usual occupation is temple service.

Ampattan.—The barber caste is known as *Ampattans* in South Travancore and as *Kshaurakans* in Central and North Travancore.

Aaryan.—A class of fishermen and boatmen.

Ari.—Abbreviated form of *Arya*, a small Tamil community confined to the southernmost taluk of Tovala. Also called *Dutan*. By traditional occupation, the caste corresponds to *Ampalavasi*.

Aryappattar.—A class of Brahmins. They are considered to be the descendants of the earliest Brahmin immigrants from the East Coast into Malabar.

Asari.—The name is synonymous with *Kammala* and may denote any of the five artisan castes, but in Malabar it is generally confined to the carpenter caste.

Atikal.—Literally servants. A class of *Ampalavasis*.

Atiyoti.—Literally vassal. A sub-division of the *Samanta* caste.

B.

Baliija.—The chief Telugu trading caste. It consists of two main divisions, *Desa* and *Peta*.

Bania.—An immigrant caste of traders and money-lenders from Northern India.

Bengali.—General name by which the natives of Bengal are known in other parts of India.

Boya.—The *Shikari* tribe of the Deccan districts, corresponding to the *Valaiyans* of the Tamil country.

Brahman.—The priestly class.

C.

Chakkala.—A Malabar caste of oil-pressers.

Chakkiyar.—Literally *Slaghyavakkukar* or good speakers. The *Chakkiyars* are a class of *Ampalavasis* whose traditional occupation is recitation of *Puranic* stories in temples.

Champan.—(*Sampan*) A sub-division of *Parayas*.

Chandalan.—The general name by which the low castes (untouchables) are called.

Channan. or Shanana.—A Tamil caste, more or less the analogue of the *Izhava* in the Malayalam-speaking tracts. Also called *Nadars*. Their traditional occupation is toddy drawing.

Chavalakkaran. A Tamil name for fishermen applied specifically to such of them as have settled inland for the sale of fish.

Chayakkaran.—An indigenous caste of dyers.

Chayakkuruppu.—A small caste of workers in lacquer.

Chemman.—A caste of Tamil leather-workers.

Chemputatti or Chembotti.—A small caste of coppersmiths.

Chetti.—The trading caste of South India. The caste is divided into 4 main sub-divisions, *viz.*, *Kottar Chetti*, *Parakkai Chetti*, *Elur Chetti* and *Attungal Chetti*.—They resemble the Tamil *Sudras* in many of their customs and manners.

Cholavan.—A small class of Weavers that probably immigrated from the Chola country.

D.

Daivampati.—Also called Brahmani. One of the sub-castes of Ampalavasi and Nayar.

Dasi.—Called also Devadasi, Devaratiar or Devatiar (servant of God), half Tamil and half Malayalam, attached to the South Travancore temples. They represented the singing and dancing castes of India, and are generally consecrated to temple service.

Dhobi.—A name used for washermen all over India.

E.

Eramkolli.—A class of washermen.

G.

Gosayi.—A name vaguely applied to pilgrims from Upper India constantly seen moving about in the South.

Gujarati.—A territorial name given to the immigrants from Gujarat. Their members are mostly traders.

I.

Ilavaniyan.—A synonym for Senaikkutaiyan (literally owner of an army). They are petty traders generally.

Ilayatu.—Literally "younger". The Ilayatus constitute the section of Malabar Brahmans who perform priestly service for the Malaya non-Brahmans.

Itayan.—The pastoral caste.

Izhavan.—Also known as Chovas in Central and North Travancore. Their chief occupations are the cultivation of the cocoanut tree and the preparation of liquors from its products. They also draw toddy and distil arrack.

Izhavatti.—The barbers of the Izhavas.

K.

Kachchhi.—An immigrant Kshatriya caste.

Kahar.—A Bengal caste of boatmen and fishermen.

Kakkalan.—The indigenous tailor caste of Malabar, now becoming reduced to the status of a wandering community.

Kallan.—A non-indigenous caste, regarded as a branch of the Kurumbas.

Kallasari.—A sub-division of Malayala Kammalas being stone workers by occupation.

Kammala.—The great artisan class.

Kangaya.—A caste of shepherds and wool weavers.

Kanikkaran.—Also called Kani. They form one of the hill communities of Travancore.

Kaniyan.—This caste consists of two endogamous sections Kaniyan proper and Tinta Kaniyans. The members of the former section follow the astrological profession. The latter are engaged in umbrella-making and spirit-exorcising.

Kannan.—The members of the Kammala caste who work in brass and copper.

Katasan.—A small caste of basket-makers and lime burners.

Kattikkaran.—A small caste found in South Travancore.

Kaundan.—A title used by Konga-Vellalas, Kurumbans, etc.

Kavarai.—The Telugu trading caste. They both manufacture and sell. Their chief article of trade is bangles. Among them now are also spinners, painters, dyers, etc. The former take the name of *Chettis*, and the latter are called *Nayakkans* and wear the sacred thread.

Kavati.—The barber caste that generally functions for the *Shanars*.

Kayasta.—The writer class of Bengal.

Kingaliar.—A sub-division of *Kallan* caste.

Kollan.—The members of the *Kammala* caste, who work in iron.

Komatti.—The great trading caste of South India.

Konkani.—An immigrant community that had come from *Konkan* and long settled in *Travancore*. Trade is their general occupation.

Konnan.—A caste regarded as a sub-division of *Kammala*.

Krishnavaka—or *Krishnan Vakakkar*.—The caste name literally means “belonging to *Krishnan*”, the pastoral incarnation of the Hindu theology. They are in *Travancore* particularly confined to the southern taluks of *Eraniel* and *Kalkulam*. Some follow the *makkathayam* law of inheritance, while others follow the *marumakkathayam*. The occupation is agriculture.

Kshatriya.—The protecting caste of the Indian social organism. The warrior caste *Malayala Kshatriya* includes *Raja* or *Tampurân*, *Koil-Tampurân*, *Tampân* and *Tirumulpât*.

Kudumi.—*Kudumis* are the *Konkana Sudras*. Like the *Ampalavasis* of the *Malabar* temples, they engage themselves in accessory duties at the shrines of the *Konkanis*. They are divided into two endogamous divisions, *Muppan* and *Idiyan*. Broadly speaking, the manufacture of fire-works is the occupation of the former class, and the preparation of beaten rice that of the latter.

Kuluvan.—A small telugu-speaking wandering caste. The catching and training of snakes is a speciality with them.

Kumbi.—The *Kumbis* are potters by occupation.

Kuravan.—A large community chiefly engaged in agricultural labour.

Kurukkal.—A class of *Ambalavasis*, said to be the descendants of the *Tamil* immigrants brought in for temple service.

Kuruppu.—A synonym of *Kavitiyan*. It is given as a sub-caste of *Nayar*, *Asari*, *Izhavan*, *Kavitiyan* and *Maran*. The term *Kuruppu* is also a title of the *Nayars* and means a “teacher” of fencing and other practices included in physical culture.

Kuttati (Koothadi).—An occupational name meaning a (rope) dancer.

Kusavan.—A caste of *Tamil* potters.

M.

Malanayar.—Also styled *Kuttilayans*. They carry on plantation work in the hills.

Malankudi.—A hill tribe.

Malappantaram.—One of the hill tribes.

Malavelan.—One of the hill tribes. (Vide *Velan*.)

Malavetan.—One of the hill tribes.

Mala Ullatan.—A hill tribe.

Malayan.—The name means a hill man.

Malayarayan.—One of the hill tribes.

Mali.—A non-indigenous agricultural class whose traditional occupation is making garlands and providing flowers for the service of temples.

Mannan.—One of the hill tribes found also in the low country.

Marakkan.—The only Hindu fishermen now in *Travancore*.

Maran.—One of the functional groups of Malabar. They are the players of musical instruments.

Maratti.—The term now denotes the various Mahratta non-Brahman castes who are mainly agriculturists, but were once a military class.

Maravan.—Originally a police and military caste. They are found chiefly in Madura and Tinnevely, and in Travancore, in the outlying taluks of Nanchinad and Shencottah.

Maravati.—Natives of Marwar.

Mukkuvan.—A caste which according to a probably erroneous tradition came originally from Ceylon. They are also limemakers, palanquin-bearers and boatmen.

Mutali.—(Mudaliar)—A titular name used by Vellalas, Kaikkalavans, etc.

Muttatu.—Literally "elder". Their manners, customs and ceremonies are like those of the Malayalee Brahmans. The Muttatus are custodians of temple properties, especially valuables and go in priestly charge of the idol in all Ustavam processions in several of the chief temples in the State. They are believed to be Malayalam analogues of the Nampiyans and Sivadvigas of the Tamil country.

Mutuvan.—One of the hill tribes, supposed to have immigrated from the Kingdom of Madura.

N.

Naidu.—This is a Telugu title returned by many non-Brahmanical castes, Balija, Besta, etc.

Nampiti.—They are of two kinds, those that wear the sacred thread and those that do not.

Nampiyar.—A class of Ampalavasis.

Namputiri.—The Malabar Brahmans.

Nattuvan.—A class of drummers.

Nayar.—Nayars are the most numerous of the non-Brahmanical Hindus in Travancore. They form an important community with agriculture as their chief occupation.

Nayati.—A hunting caste of the West Coast.

Nulayar.—A small but enterprising caste now engaged in cultivation.

O.

Ochachan.—The name is given to Marans or musical instrument players in the Tamil country.

Oddan.—This is a Telugu-speaking caste found all over India.

P.

Padayachi.—A class of Vellalas.

Pallan.—The agricultural labourers of the Tamil country.

Panan.—The word is of Tamil origin and means a tailor.

Panikkan.—A disorganised caste, the members of which follow occupations of all sorts, weaving, agriculture, trade, etc. It is also a sub-caste of Izhava while Panikkar is a sub-caste of Nayar.

Pantaram.—The name generally applied to a sect of non-Brahmanical Saivite devotees supposed to have taken to the fourth Asrama or Stage of life, *i. e.*, of the Sanyasi.

Parava.—The caste that deals with shells, ranging from those of the pearl oyster to ordinary lime shells.

Paraya.—An important caste of agriculture and industrial labourers-matting and wicker-work being their speciality.

Patnul.—A caste of silk weavers.

Pilappalli.—A class of Ampalavasis.

Pisharati.—A class of Ampalavasis.

Pontan.—A small class of palanquin-bearers.

Potti, Malayala.—Applied to all the Kerala Brahmans who do not come under the specific designation of Namputiri. The term Potti is also applied to the Tu/u Brahmans.

Potuval.—A class of Ampalavasis.

Pulayan.—The Pulayars correspond to the Cherumar or Cherumakka/ of British Malabar. Pulayas are one of the labouring classes.

Pulluvan.—The Pulluvans are the astrologers, medicine men, priests and singers in snake-groves.

Pushpakan.—A class of Ampalavasis.

R.

Raju.—A Telugu caste of agriculturists.

Reddi.—The great caste of cultivators and farmers in the Telugu country. They are also known as Kapus. They have taken to petty trade in Travancore.

S.

Saivakkurukkal.—The non-Brahmanical priests of the Saiva community among the Tamil non-Brahmans.

Sakkiliyan.—The leather-workers of the Tamil districts.

Saliyan.—The Saliyars are a Tamil weaving caste.

Samantan.—Immigrant from the Northern parts of the Malabar Coast. Samantans are said to have descended from Kshatriyas.

Silpasari.—A sub-division of the Kamma/a caste. Their occupation is sculpture and stone carving.

T.

Talavan.—A title of the Maravans.

Tantan.—The caste is mostly found in the taluks of Chirayinkil, Quilon, Karunagapalli, Karthigapalli and Mavelikara. Their occupation is tree climbing, especially cocoanut and arecanut.

Tattan.—The goldsmith section of the Tamil and Malayalam Kammalans.

Thondaman.—A sub-caste of Kallars in the East Coast.

Thondamandalam.—A sub-division of the Vellalas of the East Coast.

Tiyyattunni.—A class of Ampalavasis. Also called Agnitandava.

Kottiyan.—A distinct class of Telegu cultivators, probably the descendants of Poligars and soldiers of the Naikkan kings of Vijayanagar.

U.

Ullatans.—A hunting caste found in the low country as well as on the hills.

Uppara.—An old salt-making caste, now de-functioned and engaged in unskilled labour of kinds, such as, tank-digging, earth-works, etc.

Urali.—A historic hill-caste claiming a renowned past. They are good hunters and watchmen.

Uravalan.—A caste returned as a sub-division of Urali.

V.

Valravi.—Regarded as a sub-caste of Pantaram. They usually serve as priests in the temples of minor deities not generally worshipped by the Brahmanical classes.

Vaisyan.—The great exchanging caste in Indian society. Few people are generally known by the generic name of Vaisya, unlike the other three castes of Brahman, Kshatriya and Sudra.

Valan.—A fishing caste.

Valan.—A small caste whose occupation is the sawing of wood.

Valluvan.—The priests of the Parayas.

Vaniyan.—A corruption of Vanigyam or trade. The Vaniyans are now both oil-pressers and sellers.

Vannan.—A Tamil caste of washermen.

Variyar.—A class of Ampalavasis.

Vatukan.—Corresponds to the Baliya of the Telugu country.

Velan.—Literally, spear-men from *vel* (a spear).

Velan.—A potter caste found chiefly in Central Travancore.

Vellala.—They are the great farmer castes of the Tamil country.

Veluttedan.—The washerman caste of Malabar.

Vettuvan.—A field labouring class.

Vilkuruppu.—The priests of the Malayalam Kaimmalas. They are also makers of bows and arrows.

CHAPTER XII. OCCUPATION AND INDUSTRIES.

182. Introductory.—This is the last Chapter of the Report and is not only the most important and difficult chapter but also the least satisfactory one. It shows how each man exists and what the means adopted for his existence are. Birth, growth, education, marriage, etc., primarily depend upon one's existence and hence the importance of the Chapter. Difficulty was felt in the enumeration, tabulation and the correct interpretation of the figures dealt with on the subject. It is the considered opinion of competent and experienced authorities on Census in India and elsewhere that, if the statistics collected in connection with occupation are to be of any use, proportionate to the importance of the subject, Synchronous Census is not the time for undertaking the work; nor is the untrained and temporary staff engaged in it, the proper agency. Occupational statistics should be collected leisurely and dealt with in the intercensal period by a Permanent Census Bureau. In the United States of America, in Occupational Census, the nature and extent of holdings, the yield and value of products, the nature and value of live stock and the particulars and value of manufactures, are enquired into and returned. These details are necessary for correctly gauging the progress of the people. If the old order of things that obtained in India when each caste had a definite occupation fixed for it, had continued or if the new order of things obtaining in highly developed countries, where division of labour has so much advanced that each person follows a single occupation, had come into existence, there would have been no difficulty in the matter of taking the Occupational Census. But, as at present, India is in a transition stage, the old order of things is changing and the new order of things is coming into existence, the work is beset with difficulties. Each man follows more than one occupation, and, in the majority of cases, no account is kept of the income derived from any occupation, so that he is not in a position to say which his principle and which his subsidiary occupation is. In addition to this, some occupations considered respectable though not remunerative are returned as principal occupations. Thus, the returning of occupations as principal and subsidiary is done either at random or with some motive, with the result that the figures considerably vary from census to census. Even the distinction between actual workers and dependents does not seem to have been correctly understood and varies with the point of view taken by the enumerated and the enumerators. In the above circumstances, that the figures collected and tabulated are unsatisfactory and unfit for comparison with those of any previous Census, go without saying. As classification of occupations by classes and sub-classes does not involve much confusion, it can, to a certain extent, be relied upon, and the figures under each class and sub-class may be compared with profit with those of the corresponding classes in previous Censuses. But, the classification into orders and groups is so unreliable that any comparison with previous Censuses will not only serve no useful purpose but would also be misleading in some cases. The orders will, however, be touched in the course of the discussion, but the groups will be left alone. In addition to the Factory Industrial Census, special Censuses of markets, internal trade, cottage industries, labour, etc., were taken this time. The occupational and factory industrial Censuses will be dealt with as Parts I and II, respectively, of this Chapter and the special Censuses will be treated separately as appendices to it.

PART I.—OCCUPATION.

183. Reference to Statistics.—The following Imperial and Subsidiary Tables contain the Statistics made use of in the discussion of this part of the Chapter.

- Imperial Table XVII. Occupation or Means of Livelihood.
- XVIII. Subsidiary Occupations of Agriculturists.
- XIX. Subsidiary Agricultural Occupations of non-Agriculturists.
- XX. Distribution by Religion.
- XXI. Occupation by Selected Castes, Tribes or Races.

- Subsidiary Table
- I. General Distribution.
 - III. Distribution of agricultural and industrial population, etc.
 - IV & V. Occupations combined with agriculture.
 - VI. Occupations of females.
 - VII. Selected Occupations.
 - IX. Number of Persons employed on Railways, Post Office and Irrigation.

184. Nature and Scope of the Return.—The instructions issued to the Enumerators were practically the same as in 1911, and they are as follows:—

COLUMN 9 (*Principal Occupation*)—This column should be filled in the case of persons who actually do work or carry on business whether personally or by means of servants or who live on private property, pension, rent from houses, etc. For those who do not work or own property this column should be left blank. If the person be an actual worker, whether male or female, enter the exact nature of the work on which he or she principally depends. If the person has got two or more occupations as sources of income, the occupation from which the largest income is received should be entered in this column. On no account more than one occupation should be entered in this column.

Never enter vague terms such as agriculture, Government service, manufacture, trade, mining, cooly, etc., but specify the agricultural produce with which he is concerned; the department of Government service; the article manufactured; the merchandise traded in, etc. Below each such entry, the exact status of the person with reference to each occupation should also be shown, e. g. for agriculture, say whether cultivating land-owner, non-cultivating land-owner, cultivating tenant, non-cultivating tenant or field labourer, as the case may be; in cloth-weaving (proprietor or day labourer); liquor trade (proprietor, clerk or what); railway (engineer, porter or cooly); plumbago mining (manager, miner or what), and so on.

If the person is a maker and seller, enter him as 'maker' only and if he only sells, enter him as 'seller'. Persons temporarily out of employ should be shown as following their previous occupation.

Show gardeners and growers of special products such as cardamom, betel, pepper, etc., separately.

In the case of labourers, distinguish ordinary coolies such as earth-workers from labourers in mines stating in the latter case the particular substance mined as plumbago, mica, etc.

In the case of domestic service, state precisely the kind of service rendered and also enter the occupation of the person to whom the services are rendered, e. g., Vakil's clerk, etc. Similarly persons employed in Government service should be returned with the name of the posts occupied by them.

In the case of traders and manufacturers, specify the trade or manufacture.

Women and children who work at any occupation not being one of a purely domestic character such as cooking, must be entered in column 9 whether they earn wages or not. Rice-husking and helping in cultivation or weaving are examples of this kind.

Persons who live on the rent of land or building in towns should be entered as landlords. Mortgagees and persons who live on money lent on interest or on stock or bond or other securities, should be entered as capitalists.

A junior member of a family earning a separate income, however small, should be entered in this column and not as dependent in column 11.

COLUMN 10 (*Subsidiary Occupation*).—If a person has two or more subsidiary occupations or means of livelihood, that from which he gets the largest income should be entered in this column. On no account more than one occupation should be entered in this column.

COLUMN 11 (*Dependents on Actual Workers*).—For children, women and old or infirm persons who do not work either personally or by means of servants, enter the principal occupation of the person who supports them.

COLUMNS 9, 10 and 11.—A person entered in column 9 should be entered in column 10 if he has an additional occupation, but he should on no account be entered in column 11. Likewise a person entered in column 11 should not be entered in columns 9 and 10. If a person works for a living either under Government or under any private employer he should be entered in column 9 even though he is a junior member of a joint family and though his earning by itself be insufficient to maintain him. Such a person should not be entered in column 11. All the three columns (9, 10 and 11) should not be left blank at the same time. If a person should maintain himself he must either be himself engaged in some occupation or depend on one who is so engaged. The cook of a vakil should be entered in column 9 and not in column 11.

The Enumerators were instructed as to what they should do and what they should not. But, owing to the unrest that prevailed among certain castes and its results referred to in para 164 and owing to the want of clearness on the part of the generality of people in the matter of differentiating between principal and subsidiary occupations and actual workers and dependents, the Enumerators should not be solely blamed for the inaccuracy of the returns.

185. Changes made in the Classification.—There was no change in the number of classes and sub-classes; but sub-class IX (Persons living on their income) which was included in class C in 1911, was removed to class D in this Census. The number of the orders was increased from 55 in the last Census to 56 at present. In order to give place for two new orders "Transport by Air" and "Air Force", order 18 was amalgamated with order 19 and 40 with 41. The number of the groups was raised from 169 in 1911 to 191 in this Census.

186. General Distribution of Occupation and its Variations.—

Viewing broadly, there does not seem to be much appreciable difference between this and the last Census in regard to the proportion of population supported by each class. Class A which includes agriculture in all its forms continues to support more than half the population, immediately followed by class B (Industry and Commerce) which gives subsistence for a little more than one-fourth of the population and class D (Domestic Service and General Labour) and class C (Service and Professions) affording means of livelihood for one-eighth and one-twentieth of the population, respectively. It is only when the subject is looked into in detail, that slight differences are perceptible. The percentage of persons supported by classes A, B, C and D was 56, 27, 4 and 13 respectively in 1911, while the corresponding figures in this Census are 54, 29, 5 and 12. Thus, the proportion supported by Agriculture (A) and Miscellaneous (D) has fallen as the result of the fall in the percentage of actual workers in those classes, and that supported by Industry and Trade (B) and Administration (C) has risen for similar reasons. The percentage of actual workers has gone down from 41 in 1911 to 37 in this Census, raising the percentage of dependents from 59 to 63. This must be attributed chiefly to the phenomenal increase in the school going population which has risen from 159,913 in 1911 to 427,723 in this Census or by 167 per cent. The number of actual workers had, however, increased from 1,412,646 in 1911 to 1,482,242 in 1921 or by over 4 per cent. Taking the main classes of occupations, it is seen that the percentage of actual workers engaged in each class which was in round numbers 48, 32, 3 and 17 in 1911 stands at 45, 35, 5 and 15, respectively, at present, showing a fall of 3 and 2 per cent in classes A and D and a rise of 3 and 2 per cent in classes B and C, respectively. The fall in A is evidently due to the fact that people are leaving agriculture to more remunerative occupations and that in D to the better care and attention bestowed this time to the enumeration of occupations with the result that the number under "Unspecified and Insufficiently described occupations" has come down. The rise in class B is obviously due to the tendency on the part of the people to take to industrial pursuits and that in C to the spread of education and the strengthening of the number of the Government and Municipal departments of the State. The percentage of dependents for the whole State has risen from 59 in 1911 to 63 at the present Census. In 1911, they

STATEMENT SHOWING THE PERCENTAGE

Mountainous	61.2	22.1	4.1	11.9

stood at 64, 51, 67 and 48 per cent. for the classes A, B, C and D, respectively. This time while their proportion has increased to 69, 56 and 54 per cent. in classes A, B and D, it has fallen to 63 per cent in class C. The fall in C may be explained biologically by the fact that, as the persons, male and female composing that class are expected to be more educated than those in other classes, the number of children born would be less. In as much as the dependents are chiefly composed of children, a decrease in the latter causes diminution in the former. As there is alteration in the area as well as in the number of the Divisions and Taluks into which the State has been divided and as no occupational figures for units smaller than Taluks were tabulated in previous Censuses, so as to admit of adjustments being made this time, the figures of this Census cannot be properly compared with those of the past Censuses. The proportion of population supported by each class, and the percentage of actual workers and dependents in it for each Administrative and Natural Division, are given in the marginal table.

187. Sub-Class I (Orders 1 & 2 and Groups 1 to 18).—Agriculture is a vague term and is not defined anywhere. In one place it is said that agriculture includes the first 7 groups in order 1, while in another it is stated that the

term comprises only the first 5 groups. It was only after the enumeration was over that the term was defined and delimited to 'Ordinary cultivation' returned in the first 5 groups, excluding groups 6 and 7 relating to "Growing of special products and market gardening." Even after this, the limitation was not maintained through out. While in the Imperial tables the term was limited to groups 1 to 5, in subsidiary Table III, all the 7 groups were included. The distinction made between (a) ordinary cultivation and (b) cultivation of special products is not clear either to the agriculturists or to others. If the former is confined to the cultivation of staple articles of food, it must vary in places according to the nature of the staple food used. Thus, rice is the staple food in one place, wheat in another, ragi in a third, and so on. In England and in the United States of America, a separate group is given for cereals and corn. The provision of such a group here will avoid confusion. So far as Travancore is concerned, tapioca is replacing rice among the lower classes, and more than 50 per cent. of the population subsist on it and it is therefore to be looked upon as a staple article of food more than rice which only supplies the needs of less than 50 per cent. of the people. However, in the instructions given to the Enumerators here, it was required that the article cultivated should be noted and not merely the term "agriculture"; and only paddy cultivation was included under the heading "ordinary cultivation," the cultivation of other articles such as tapioca being included under special products. A large number of persons, more than two hundred thousand, returned their occupations without specifying the product cultivated; and as separate figures were given for almost all the special products, the number was included in 1 (a). An additional cause for confusion was introduced in the last census by the sub-division of groups 1 and 2 of order 1 (a) into (i) non-cultivating land-owner and non-cultivating tenant and (ii) cultivating land-owner and cultivating tenant. According to this classification, a non-cultivating tenant may be both a rent receiver and a rent payer, with respect to one and the same land. This classification is not only confusing but appears to be an unnecessary refinement. The most natural and easily understandable classification would be to sub-divide groups 1 and 2 into (a) land owner with 2 subdivisions cultivating and non-cultivating and (b) tenant. The number of actual workers in sub-class I has now fallen by 2 per cent. as compared with that in 1911. But, if the sub-divisions (a) and (b) of order 1 be taken separately, a decrease of 5 per cent. in (a) and an increase of 16 per cent. in (b) are observed. This is very significant and indicates that, as people withdraw from the cultivation of paddy (a) they go in largely for that of commercial crops (b) which is found to be more remunerative than paddy cultivation. While Agents, Managers, etc., have increased from 590 to 1121, field labourers and farm servants have decreased by 18 per cent. There are no farms in this State, in the proper sense of the term. The servants in gardens assist the owners in domestic work and as such were returned under domestic service. The variations observed in the case of agents and managers etc., may be attributed to the fact, that paddy cultivation not having been a paying concern, particularly for those who do not cultivate their own lands, some of the rent receivers might have entrusted their lands to agents and taken up more remunerative occupations. With respect to the increase in rent payers, it is highly probable that, consequent on the rise in wages and demand for labour in occupations other than paddy cultivation, labourers engaged in those occupations might have invested their savings in lands and cultivated them themselves. The explanation for the decrease in field labourers may be that on account of low wages paid for paddy cultivation, they might have left the occupations connected with it and resorted to others in which higher wages could be earned.

The number of actual workers has increased in 1 (b) by 16 per cent. which is evidently due to the increase in the number of cultivators of special products such as tea, rubber and tapioca, on account of the liberal policy followed by Government in the matter of registration of waste lands in the names of private individuals. The increase of 52 per cent. in (c) is chiefly contributed by wood cutters, firewood collectors, etc. The clearing of forests from waste lands and demand for fuel from outside have attracted a large number of persons to the work. There is a fall of 50

per cent. in the number employed in occupation (d) (Breeding of cattle, etc.). In the Cattle Census taken, a fall is observed in the number of cattle also. As people of this country do not use much milk, the purpose of which is served by cocoanut and as paddy cultivation requiring cattle for ploughing has been losing its attraction, the necessity for cattle and their keepers is not much felt, and consequently a fall in their number may be naturally expected. In 1911, the number actually employed in the raising of small animals (e) was 3. Evidently there must have been some omission. It is known that a number of persons breed ducks etc. in the State and take them from place to place for manuring paddy fields. During the last decade, the breeding of silk worm has also been started. The increase now found in sub-order (e) from 3 in 1911 to 450 at present is, therefore, explicable. Fishing and hunting, particularly the former, show an increase of 18 per cent. which is obviously due to the impetus given to fish curing by the opening up of several fish-curing yards at the instance of Government.

188. Sub-Class II (Orders 3, 4 & 5 and Groups 21, 22 & 23).—The number of workers in order 3 has decreased from 635 in 1911 to 246 in this Census. This is due to the fact that the plumbago mines of Nedumangad and other places which were working in 1911, have now been closed. Order 4 (Quarries of hard rocks) was unrepresented in 1911. As laterite is used extensively for construction of houses, granite for road materials and lime stone for making lime, the absence of figures in 1911 must be due to omission. Owing to the opening of additional salt pans during the decade, the number of actual workers in order 5 shows an increase this time as compared with that of 1911.

189. Sub-Class III (Orders 6 to 18 and Groups 25 to 103).—The actual workers in this sub-class have increased by 13·5 per cent. on the whole. But orders 10, 13, 15 and 18 show higher percentages of increase, amounting to 19·9, 20·6, 20·0 and 22·0, respectively. These may be due to the fact that, owing to the increased prosperity of the people, the number of buildings in the State and consequently the number of persons engaged in building industries and manufacture of bricks, tiles, etc., and also those engaged in industries of dress and toilet and in editing and managing newspapers and magazines, have gone up correspondingly. The number of persons engaged in order 7 (Hides and skin) has increased from 61 to 100, in order 14 (Furniture) from 53 to 114, in order 16 (Construction of means of transport) from 233 to 435 and order 17 (Production and transmission of physical forces) from 16 to 72. All these may be explained partly by the incredibly low numbers returned in 1911 and partly by the expansion of old industries and starting of new ones. The small increase of 7·9 per cent noticed in order 12 (Food industries) is the result of the fall in the number of toddy drawers, brewers, etc., caused by the anti-drinking agitation obtaining in the State, as in other parts of India. The increase of only 6·4 per cent. found in order 11 (Chemical products) may be accounted for by the exodus of Chakkalas, the professional oil pressers from their fold to that of Nairs, as mentioned in para 172.

190. Sub-Class IV (Orders 20 to 23 and Groups 105 to 120).—The increase in the number of actual workers in this sub-class (Transport) is 11 per cent. The large increase from 567 to 1,090 found in order 22 (Transport by rail) is evidently due to the extension of the railway to the Capital of the State, resulting in the increase of the number of employes, and the fall from 1553 to 1515 observed in order 23 (Post, Anchal, etc.,) to the decrease in the number of Anchal runners, etc. caused by the employment of motor and railway service for the conveyance of mails.

191. Sub-Class V (Orders 24 to 40 and Groups 121 to 154).—The number of actual workers has risen by 14 per cent. in this sub-class. The small increase of 9·7 per cent. observed in order 26 (Trade in textiles) is the result of the import of a limited quantity of piece goods due to depression in the trade of foreign made cloths. The small increase of only 1·2 per cent. noticed in order 38 (Trade in fuel) is really inexplicable. Order 24 (Bank establishments or credit exchange and

insurance) shows an increase of only 6·3 per cent. and it must be due to the chances of some of the money lenders having returned themselves as Brokers and commission agents (order 25), whose number has increased from 285 in 1911 to 403 at present. The large increase of 22 per cent. in order 30 (Trade in pottery, bricks and tiles) and of 26 per cent. in order 36 (Trade in building materials) may be caused by the construction of a large number of houses for which bricks and tiles are required. The increase from 15 to 59 observed in order 31 (Trade in chemical products) may be attributed to the high demand for petrol used for motor vehicles, oil engines, etc., in the State. The rise of 20 per cent. in order 35 (Trade in furniture) may be the result of the increased demand for them created by the improvement of the material prosperity of the people. In order 29 (Trade in metal) and 34 (Trade in clothing and toilet articles) the number had risen from the incredibly low figures of 30 and 29 in 1911 to 135 and 53 respectively in 1921. The increase of 41 per cent. noticed in order 28 (Trade in wood) is evidently due to the large quantity of timber available for sale on account of the clearing of waste lands registered in the name of private individuals.

192. Sub-Class VI (Orders 41 to 44 and Groups 155 to 160).—The number engaged in this sub-class has increased by 15 per cent. The increase is chiefly contributed by police force. The ministerial staff is also included in the force to which it is attached.

193. Sub-Class VII (Order 45 and Groups 161 to 164).—This sub-class includes all Government and Municipal employes except those who have been assigned to the specific heads of Police, Agriculture, Medical, etc., and the number has increased by 26 per cent. Under Group 161 "Service of the State" are given the employes of British Government and under 162 "Service of Indian and Foreign States" the employes of this Government, as required in the instructions. The increase found in the last 3 groups of the order is the result of the development of administration, both General and Municipal.

194. Sub-Class VIII (Orders 46 to 50 and Groups 165 to 179).—The actual workers in this sub-class have increased by 72 per cent. during the decade. The increase noticed is obviously due to the remarkable advancement in education among all classes of people which characterised the decade under review. In the case of Medicine (order 48) an increase of 109 per cent. is noticed. It is said that at the age of 40, a man becomes either a fool or a physician. This is applicable largely to this State. Every Ex-Compounder, Warder or Nurse is a Doctor here. The tendency among Kaniyans (Astrologers) to return themselves as *Vaidyans* (Medical men) may have also contributed to swell the number. The combination of astrology with medicine in a single person is indeed an advantage. The prognosis made by the knowledge of medical lore may be confirmed by astrological predictions. Persons resort to this means of livelihood if they fail in other walks of life. The Ayurvedic College, which was opened during the decade, has trained a large number of persons in the medical science.

195. Sub-Class IX (Order 51 and Group 180).—This sub-class was included in class C in 1911 but was removed from it and taken to class D in this Census. The actual workers in this sub-class show an increase of 21 per cent. which is due to the rise in the number of pensioners and proprietors and share holders in Companies and Banks which have also gone up considerably during the decade.

196. Sub-Class X (Order 52 and Groups 181 to 183).—The increase observed in this sub-class is very little being only 0·5 per cent. Owing to high demand for labour, the cost of maintaining domestic servants has much increased, so that only well-to-do persons are able to employ their services.

197. Sub-Class XI (Order 53 and Groups 184 to 187).—The fall in this sub-class amounting to 7 per cent. is evidently due to better enumeration and the consequent reduction in the number of "Insufficiently described occupations."

198. Sub-Class XII (Orders 54 to 56 and Groups 188 to 191).—A decrease of 13 per cent. is observed in this sub-class, which is accounted for by the fact that, while, in the last Census, inmates of hospitals were included in sub-class XII, this time, they were returned under the occupations they had been following before admission in the hospitals. The Beggars, Vagrants, etc., and those following other unclassified non-productive industries, have also fallen.

199. Workers and Dependents.—The proportion which the number of actual workers and dependents bear to each other and to the total population depends upon several factors, such as, education, social position, law of inheritance, marital condition, facilities of employment, etc. In countries where the law of primogeniture obtains, all except the eldest male of a family shift for themselves. Education given to females enlarges the scope of their employments. Wherever there is purdah system, females seldom get out and seek employment and are mostly dependents. Unmarried females in India, unlike in European countries, get themselves employed less frequently than married women or widows. Education among boys and girls keep them away from work. In calculating the proportion of actual workers to the total population, it is usual in Europe and America to leave out children under 10 years of age from the population but it is not the case in Indian Census. In the statement given in the margin are compared the proportion of actual workers and de-

STATEMENT SHOWING THE PERCENTAGE OF ACTUAL WORKERS AND DEPENDENTS OF EACH SEX ON THE TOTAL POPULATION AND IN EACH SEX.

COUNTRY	Year.	Actual Workers.			Dependents.		
		Persons.	Males.	Females.	Persons.	Males.	Females.
England and Wales.	1911	45	66	26	55	34	74
India	1911	47	63	31	53	37	69
Travancore	1921	37	51	23	63	49	77
Ajmer-Merwara	1921	41	71	45	5	29	86
Baroda	1921	41	56	24	59	44	76
Cochin	1921	44	60	28	56	40	72
Madras	1921	49	61	35	52	39	65
Mysore	1921	27	42	14	73	58	55
Rajapurana	1921	35	67	47	65	33	53

pendents on the total population in England, India, Travancore and other places. It will be seen therefrom that the great difference observed in the percentages of actual workers and dependents in India and the provinces and States given, cannot be taken as representing the actual state of affairs. It is unlikely that in one Province, more than 70 and in another less than 55 per cent. are unoccupied. The variations may be partly due to the difference in the view point taken in differentiating between actual workers and dependents. So far as Travancore is concerned, the percentage of dependents has increased from 59 in 1911 to 63 in this Census and the increase is due chiefly to the phenomenal rise in the school going population. The percentage of male and female dependents on their total population which stood at 44 and 73 in 1911 has risen to 49 and 77, respectively, at present.

Considering the subject with reference to the nature of occupations, it will be

STATEMENT SHOWING THE PERCENTAGE OF DEPENDENTS ON THE TOTAL POPULATION SUPPORTED BY EACH SUB-CLASS.

Sub-Class.	Percentage of dependents.	Sub-Class.	Percentage of dependents.
I	69	VII	69
II	53	VIII	60
III	54	IX	56
IV	65	X	53
V	55	XI	55
VI	71	XII	27

seen from the inset that the largest percentage of dependents is in the Public Force (VI), which is followed in order by Agriculture and Public administration (I & VII), Transport (IV). Professions and liberal arts (VIII), Persons living on their income (IX), Trade and Insufficiently described occupations (V & XI), Industry III and Exploitation of minerals and Domestic service (II & X). Lastly comes the Unproductive (XII).

The caste system among the Hindus has a great deal to do in determining

STATEMENT SHOWING THE PERCENTAGE OF DEPENDENTS ON THE TOTAL POPULATION OF EACH CASTE

Caste.	per cent.	Caste.	per cent.
Ambakavasi	59	Marakkan	43
Ambattan	57	Maran	46
Brahmin	64	Nair	65
Chakkalan	49	Parayan	50
Channan	64	Pulayan	59
Chett.	54	Sahyan	57
Izhavan	60	Valan	46
Kammalan	64	Vaniyan	64
Kaniyan	60	Velan	59
Konkani	39	Vellalan	65
Kuravan	50	Veluchedan	47

the proportion of dependents and it is illustrated in the statement given in the margin. The castes showing percentages higher than the average for the State (63) are Brahmin, Channan, Kammalan, Nair, Vaniyan and Vellalan, while the rest show lower percentages. The comparatively low percentages observed among Chakkalan

and Maran are obviously due to a large number of desertions from their ranks as mentioned in para 172.

200. Occupation of Females.—Employment of women in India including this State, depends upon several factors such as religion, caste, nature of occupation, material and marital condition of the people. Among Musalmans who observe purdah system, employment of females is extremely rare. The higher the caste, the lower the number of women employed. Among the well-to-do, women do not seek employment at all. In Western Countries unmarried females are employed more largely than married women or widows. The reverse is the case here. Lastly, the nature of the occupation determines the employment of women. Females largely resort to agricultural occupations, domestic service and industries such

XII.	0.50

as lace embroidery, pottery, etc. For works requiring perseverance, little muscular effort and sustained application, they are generally preferred. The total number of female actual workers in 1911 was 27 per cent. on the total female population of all ages and 37 per cent. on the female population of over 10 years; and in 1921, the proportions came down to 23 and 31 per cent., respectively. The increase observed in the number of females employed in the factories of the tea and rubber estates in the Hills, is chiefly contributed by female coolies recruited from outside. Coming to the nature of occupations, it will be seen from the inset which gives the percentage of females actually employed in each sub-class on the total number of female actual workers, that the largest percentage 29 is employed in agriculture (i), and that Industry (iii), Occupation undefined (xi) and Trade (v) follow in order with 27, 25 and 14, respectively. Sub-classes (vi) and (vii) are un-

represented. The small percentage observed in domestic service (x) may be accounted for by the limited employment of servants, on account of dearness of labour.

201. Partially Agriculturists.—By the term "Partially Agriculturists" is meant the actual workers who have returned agriculture as their subsidiary occupation. As, in this Census, agriculture is limited to groups 1 to 5, the actual workers whose occupation is any one falling under groups 1 to 5, cannot have agriculture also as their subsidiary occupation. In the last Census, agriculture was taken to include groups 1 to 7 and hence the figures of this Census cannot be correctly compared with those of 1911. Further, in this Census, in Table XVIII, under "agricultural labourer", agents and managers, etc., are required to be included which was not the case in the last Census. The object with which this special heading was provided is stated in the Census Report of India for 1911, as follows:—
 "At the present Census, statistics have been compiled for all occupations connected with agriculture both when agriculture was the principal, and also when it was the subsidiary, occupation. We have thus for the first time complete information as to the extent to which the population is dependent on agriculture." If the statistics are intended to show, as they are meant, the extent to which the population is supported by agriculture, either wholly or partly, or in other words, to show the extent to which agriculture goes for the support of the population in any degree, then the statistics compiled have failed in their object, as the instructions given for collecting the information on the subject are incomplete and indefinite. The instructions given are:—"when a man has two occupations, the principal one is that on which he relies mainly for his support and from which he gets the major portion of his income. A subsidiary occupation should be entered *if followed at any time of the year*. Only one subsidiary occupation (the most important one) should be entered in column 10." Suppose that a man has three occupations of which the principal one is teaching and the subsidiary ones are medical practice and agriculture and that between the two subsidiary occupations he gets more income from the former than

from the latter. Then, according to the instructions, medical practice should be entered as the subsidiary occupation and not agriculture, though he is dependent on it to some extent. Thus, in this case “complete information as to the extent to

XII.	...

which the population is dependent on agriculture” is not possible to collect. Complete information on the subject can be collected only if the instructions are modified to the effect that, in cases in which a man has more than one subsidiary occupation of which one is agriculture, it should be entered as his subsidiary occupation even though he may not receive as much income from it as from the other subsidiary occupation. This aspect of the question has been brought to the notice of the Census Commissioner for India. The total number of partially agriculturists had fallen from 7,005 in 1911 to 6,135 in 1921. The proportion of actual workers in each Sub-class who are partially agriculturists are given in the marginal statement. The percentage of actual workers in agriculture (groups 1 to 5) who have subsidiary occupations to supplement their income has risen from 6 in 1911 to 9 in this Census. This, together with the fall in partially agriculturist, may be taken as an indication that agriculture has been losing its attraction.

202. Rural and Urban Occupations.—Most of the towns in this State are merely outgrown villages and hence the difference between the occupations followed in towns and those pursued in villages, is very little. There is no village in the State where the ticking of the sewing machine is not heard, neither a bazaar in which school exercise books are not hung for sale, nor a house where kerosine oil is not used for lighting. The difference between the occupations followed in rural tracts and those pursued in urban areas is only one of degree and not of kind. In villages, occupations connected with agriculture will be comparatively large while, in towns, those connected with service, learned professions, industry and commerce will preponderate. Subsidiary Table I gives further information on the subject.

203. Distribution of Occupation by Religion.—Table XX gives the proportion of population supported by each order in each religion. As it does not furnish any information about the proportion of dependents and of actual workers in each sex, a statement is given at the side supplying this information. It will be

STATEMENT SHOWING THE PERCENTAGE OF DEPENDENTS AND ACTUAL WORKERS OF PERSONS, MALES AND FEMALES IN EACH RELIGION ON THEIR TOTAL POPULATION.

Religion.	Number of dependents and their percentage on the total population of each Religion.	Number of actual workers and their percentage on the total population of each religion and sex.		
		Persons.	Males.	Females.
All religions.	2,523,820 (63)	1,492,242 (37)	1,037,570 (51)	444,673 (22)
Hindus.	1,598,232 (62)	951,432 (38)	639,999 (52)	311,433 (25)
Musalman.	185,043 (70)	85,435 (30)	66,502 (45)	18,933 (14)
Christians.	734,829 (64)	438,105 (36)	326,822 (51)	111,283 (19)
Animists.	5,487 (43)	7,150 (57)	4,147 (63)	3,003 (46)

The percentages are shown within brackets.

seen therefrom that the highest percentage of dependents is found among the Musalmans and the lowest among the Animists. The existence of purdah system among Musalman females which prevents them from getting themselves employed accounts for the high percentage of dependents among them. In the case of Animists, both men and women work. The slightly higher ratio observed among the Christians as compared with the Hindus may perhaps be due to the fact that the number of children attending schools among Christians is greater than that among the Hindus. Coming to actual workers, it is observed that the highest percentage is found, both in males and females, among the Animists, and the lowest among the Musalmans. The same reasons given for the

variations among the dependents of the two religionists hold good to explain the differences among them so far as female actual workers are concerned. The low proportion of male actual workers among Musalmans as compared with the ratio among the Hindus and the Christians may be attributed partly to the restriction of their employment to certain occupations only. They are very sparsely represented in domestic service, in law, in general labour, etc. The higher percentage of occupied females among the Hindus as compared with Christians, is evidently due to the fact that Paraya, Pulaya and Kurava females largely engage themselves in doing cooly work.

204. Occupation by Caste and its Variation.—

STATEMENT SHOWING THE PERCENTAGE OF MALES
ACTUALLY FOLLOWING THEIR TRADITIONAL
OCCUPATION ON THEIR TOTAL WORKERS.

Caste.	Traditional Occupa- tion.	Percentage.	
		1911	1921
Class I.			
Ambattan	... Shaving.	96	85
Channun	... Toddy drawing.	33	29
Izhavan	... Do. Do.	20	8
Kammalan	... Artisan craft.	86	84
Marakkan	... Boating.	20	25

Saliyan	... Weaving.	75	60
Valan	... Boatmng.	71	50
Class II.			
Ambalavasi	... Temple service.	62	53
Brahmin	... Priesthood.	14	11
Chakkalan	... Oil Pressing.	36	18
Chetti	... Trade.	19	25
Kaniyan	... Astrology.	48	47
Konkani	... Trade.	52	68
Kuravan	... Labour.	78	78
Nair	... Agriculture.	70	74
Parayan	... Field Labour.	85	64
Pulayan	... Do. Do.	98	82
Vaniyan	... Oil Pressing.	79	45
Velan	... Sorcery.	69	18
Vellalan	... Azriculture.	53	53
Veluthedan	... Washing.	89	93

occupations which do not require for their performance any inherited aptitude, but need only a little training and experience. In the case of Ambalavasis and Brahmins, it has to be stated that only a small minority of them attend to temple service and priestly functions, and only a few of them live entirely by these occupations. The marginal table gives the variations in the proportions of males who follow one or other of the traditional occupations coming under each of the two classes mentioned above. It will be seen therefrom that 2 castes (Marakkan, and Maran) show increases in their percentages. In the case of the first, the rise may be accounted for by the increase in water transports, and in the other case, the increase is only apparent as the proportion is calculated on their (Maran) population which has fallen by 60·5 per cent. for reasons given in para 172. Of the castes that show decrease, the Channan and Izhavan are noteworthy. They are perhaps giving effect to their resolution that they should discontinue their traditional occupation. The fall in the weaving caste may be due to other castes having taken up new methods of weaving which do not require any inherited skill or long training. Among those that follow traditional occupations which do not require inherited skill, Chetti, Konkani, Nair, and Veluthedan show increased percentages. The rise in Chetti and Konkani, the occupations of both of whom are trade, is what may be expected, as people resort to trade more at present than before. The inclusion of Chakkala, Maran, etc., among Nairs, mentioned in para 172 may perhaps account for the increase in the percentage of the

latter as these castes might have returned agriculture as their occupation instead of their traditional ones. Ambalavasis, Brahmins, Chakkalas, Vaniyans, Parayans and Pulayans show each a fall. In the case of the first two, obviously, there has been no demand for their services. As mechanical power-driven oil mills have come into use and as some of the Chakkalas have returned themselves as Nairs, the number of the primitive indigenous oil mills and the persons whose occupation consists in operating them, have fallen. Conversion to Christianity and low wages paid for agricultural labour might have been the causes for the fall among Pulayas and Parayas.

205. Conclusion.—The imperfect and unsatisfactory nature of the statistics collected and dealt with in the chapter has been pointed out and it is but desirable that adequate remedies should be suggested also. If it is not possible to remove the Occupational Census from the General Synchronous Census and make arrangements for conducting it in the intercensal period through the agency of the Permanent Bureau of Statistics and if it is thought necessary to continue the existing practice, then the enquiry may be simplified so as to ensure sufficiently accurate figures being promptly collected and tabulated. In countries where division of labour has advanced, multiplication of groups of occupations may be necessary; but, in India, if not in the whole of it, at least in Provinces where old order of things has not changed, or which are in the transition stage, diminution of groups is called for rather than their multiplication. The existing number of orders, *viz.*, 56, is sufficiently representative and fairly exhaustive and can therefore be adopted without any sub-division into groups. If necessary, the number may be increased a little so as to enable separate orders being given to important groups. Another point for consideration is the utility or otherwise of returning subsidiary occupations. Under existing circumstances, a large majority of persons have more than one occupation. If this State is taken as an example, almost every house in it, except in rare cases, has a garden attached to it, in which are grown cocoanuts, jack, pepper, etc., but the income from them will not be sufficient to meet the demands of the owner or occupier, so as to constitute his principal occupation though he depends to some extent on it for his maintenance. Further, an officer drawing a big salary generally invests his savings in the purchase of shares, lands or house property; but he does not usually give them as his subsidiary occupation. Omissions of similar nature, particularly in respect of the occupations of well-to-do persons, are pretty large. Inaccuracies of this kind could be avoided only by doing away with the difference between principal and subsidiary occupations and noting the chief occupation that a person follows. The imperfections of the enquiries regarding partially agriculturists have been referred to in para 201 and these enquiries also can be safely dispensed with. Lastly, there is the question of actual workers and dependents. It was pointed out in a previous paragraph that the difference observed between the different Provinces and States in the matter of the proportion which actual workers bear to dependents might be due to the difference in the point of view taken by Census Officers in distinguishing the two. Among certain castes and religions, particularly among those that follow Makkathayam Law of Inheritance, no husband will return himself as a dependent of his wife and no children of their mother, while their father is living, although, as a matter of fact, all of them are her dependents. In England and Wales, the number of persons unoccupied is given, not for actual workers of each occupation, but for the country as a whole. Similarly, instead of noting the number of dependents which each worker has to support, the total number of the unoccupied in each Taluk or District may be recorded. It would be interesting and instructive information, if the unoccupied is classified by age period, religion and sex.

SUBSIDIARY TABLE I—General Distribution by Occupation.

CLASS, SUB-CLASS AND ORDER	Number per 10,000 of total population.		Percentage in each class, sub-class and order of.		Percentage of actual workers employed		Percentage of dependents to actual workers.

CHAPTER XII.

PART II.—FACTORY INDUSTRIES.

206. Scope and Nature of the Enquiry.—In the Census of 1911, the enquiry with regard to the Factory industries of the State was confined to establishments employing 20 or more persons and the information was returned in a special schedule. On the present occasion, the extent and scope of the enquiry were extended. All establishments employing 10 or more persons were included and the information was collected in 2 schedules one showing the particulars of the direction and superior staff together with details regarding the power employed and (in textile establishments) the number of looms at work, and the other giving information regarding the inferior staff of workmen, skilled and unskilled.

207. Reference to Statistics.—The statistics collected in the schedules are tabulated and exhibited in the following 7 parts of Imperial Table XXII and in 8 Subsidiary Tables.

Imperial Table XXII, Part I. State Summary.

- II. Distribution by Divisions.
- III. Industrial establishments classified according to the class of Owners and Managers.
- IV. Caste or Race and Birthplace of skilled workmen classified according to their Industry and Occupation.
- V. Caste or Race and Birthplace of unskilled labourers classified according to the Industry in which they are working.
- VI. Details of Power employed :—
 - (1) For establishments using Steam, Oil, Gas, Water, etc.
 - (2) For establishments using Electric Power generated on the Premises.
 - (3) For establishments using Electric Power supplied from outside.
- VII. Number of Looms in use in Textile establishments.

Subsidiary Table I. Distribution of Industries and persons employed.

- II. Particulars of establishments employing 20 or more persons in 1911 and 1921.
- III. Organisation of establishments.
- IV. Place of origin of skilled employes.
- V. Place of origin of unskilled labour.
- VI. Distribution of certain races in certain industrial establishments
- VII. Proportional distribution of adult women and of children of each sex in different industries.
- VIII. Distribution of Power.

208. Number, Classification and Distribution of Industries and Number of Persons employed.—The total number of factories from which schedules were received was 327 including 10 Government institutions; and the number

of persons employed in them was 33,829 (22,983 males and 10,846 females). Textiles and connected industries have the largest number of establishments, 126, but they employ only 9,306 persons, while Growing of special products have the largest number of employes 17,317, but they number only 115. Glass and Earthenware industries come next with 36 establishments and 3,357 operatives, followed by Industries connected with chemical products numbering 19 and giving work for 1,204 persons, Industries of luxury amounting to 12 and engaging 813 persons and Food industries aggregating 7 and giving means of subsistence for 237 workmen. Construction of means of transport and communication and Production and transmission of physical forces come at the bottom represented by one in each industry employing 49 and 63 persons respectively, preceded by Wood, etc., industries numbering 4 and giving work for 330 labourers and 6 Metal industries run by 1,153 persons (males 956 and females 197). The tabular statement given in the margin shows the distribution of the several industries among the Administrative Divisions of the State. It will be observed therefrom that the Southern Division stands first with the largest number of establishments, *etc.*, 125 and that the Northern Division comes last, with 43 institutions, while the Central and the High Range Divisions occupy

GROUP NUMBER	INDUSTRIES	NUMBER OF ESTABLISHMENTS IN			
		SOUTHERN DIVISION	CENTRAL DIVISION	NORTHERN DIVISION	HIGH RANGE DIVISION
I	Growing of special products	8	36	6	65
II	Textiles and connected industries	76	27	23	..
VI	Wood, etc., industries	..	2	2	..

VIII	Glass and Earthenware industries	23	11	2	..
IX	Industries connected with chemical products	19	6	3	..
X	Food industries	1	3	2	1
XIV	Construction of means of transport and communication	1	..
XV	Production, application and transmission of physical forces	1
YVI	Industries of luxuries	3	5	4	..
	Total	125	91	43	68

intermediate places, with 91 and 68 industries, respectively.

209. Variation between 1911 and 1921.—Taking the institutions that employ 20 or more hands for comparison with those in 1911, it is seen that their total number in 1921 was 208 against 108 in 1911 showing an increase of 93 per cent. and that the number of employes had risen from 14,941 in 1911 to 32,054 in 1921, *i. e.*, by 115 per cent. This increase is shared by all the industries except rice milling in which the number of establishment remained the same as in 1911 and Oil-mills which had fallen in number from 12 in 1911 to 7 in 1921. The number of persons employed in rice mills had, however, increased from 88 to 114 while it had fallen from 659 in 1911 to 641 in 1921 in oil mills. If the number of establishments employing between 10 and 20 hands is included, the number rises from 3 to 5 in rice mills and 7 to 8 in oil mills. The industries of Motor transports and Physical forces were newly started in the decade under review. In the absence of figures for institutions employing over 10 and below 20 hands for 1911 it is not possible to point out the exact variations between 1911 and 1921. That there had been no increase in rice and oil mills, whilst all other industries show marked rise is worth noting and demands explanation. With respect to rice, it may be stated that, in as much as there has been no increase in the output of home grown paddy, there is no necessity for more mills. From the trade returns it is seen that the quantity of cocoanut oil exported in 1921 shows an increase of 57 per cent. over that exported in 1911. According to the Occupation Table, the number of persons engaged in oil pressing does not show an increase in proportion to the rise in the general population. How is it then possible to export oil exceeding by 57 per cent the

quantity exported in 1911, with less number of oil mills and oil pressers, is not explicable except on the supposition that the output of oil from each mill is considerably higher in this census than in the last one.

210. Organisation of Establishments.--Out of a total of 327 establishments, 10 are owned by Government, 102 by Registered Companies and 215 by private persons. Among the Registered Companies, 88 are directed by Europeans and Anglo-Indians, 12 by Indians and 2 by persons of different races. Of the 215 private companies, 26 are owned by Europeans and Anglo-Indians and the rest 186, by Indians. All the Directors in the 12 Indian Registered Companies are the natives of the State. Of the private companies owned by Indians, 179 belong to Travancoreans and 7 to outsiders. Taking the establishments that employ 20 or more hands and comparing them with those of 1911 it is seen that the number of establishments owned by Government had increased from 5 in 1911 to 6 in 1921, and by the Registered Companies from 65 in 1911 to 96 in 1921 while those owned by private persons had risen from 38 to 106. Among the Directors of the Registered Companies, European and Anglo-Indian Directors rose from 50 to 82 while Indian Directors fell from 15 to 14. In the privately owned institutions the number owned by Europeans and Anglo-Indians has risen from 11 to 22 and that by Indians from 27 to 84.

211. Place of Origin of Skilled Labourers and their Number.—The total number of skilled labourers employed in all the institutions was 14,721 (9,514 males and 5,207 females) of whom 9,636 (6,215 males and 3,421 females) *i. e.*, 65 per cent are Travancoreans. Of the rest, more than half were from the Tinnevely District and one-fourth from Madura. Chingleput which is farther away from the State than either Cochin or Coimbatore supplied 797 persons against 367 furnished by Cochin and 126 by Coimbatore. The largest number recruited from outside was for Growing of special products, for Glass and Earthenware industries and for Industries connected with chemical products. Comparing with the figures of the last Census, the total number of skilled workmen had risen from 3,859 (2,037 males and 1,822 females) in 1911 to 13,847 (8,798 males and 5,049 females) in 1921 or by 263 per cent. while Travancoreans had risen from 3,497 to 8,974 or by 156 per cent.

212. Place of Origin of Unskilled Labourers.—The total number of unskilled labourers employed in all the establishments was 17,374 (11,748 males and 5,626 females) of whom 9,612 (7,145 males and 2,467 females) are natives of the State, giving a percentage of 55.3. This is significant, compared with the percentage of skilled employes of whom 65 per cent. are the natives of the State. The largest number of outsiders was from Tinnevely 3,727 followed by Madura with 1,319 and Coimbatore with 691. Chingleput, as in the case of skilled labour, supplied 642 persons which is more than the number supplied by Cochin by 612. The recruitment of outsiders was largely for Growing of special products and for Metal industries. In establishments employing 20 or more hands the number employed in 1921 was 16,651 against 9,902 in 1911 showing an increase of 69 per cent.

213. Distribution of certain Races or Castes in certain Industrial Establishments.—For direction, supervision, and clerical work, the Europeans and Anglo-Indians employed, number in all the industries, 253 and distributed as follows:—Managers 107, Supervising Staff 126, Clerical staff 20, the corresponding numbers among the Indians being 1,481, 239, 534 and 708. Of these 1,289 are Travancoreans and 192 outsiders. The races and castes of the Indians with their strength are: Hindus 786, Indian Christians 660, Musalmans 31 and Parsis 4. Europeans are largely represented in the industry of Growing of special products (tea and rubber) and in Textile and connected industries. In factories employing 20 or more hands, the number of Europeans and Anglo-Indians had risen from 149 in 1911 to 242 in 1921 *i. e.*, 62 per cent. while that of Indians from 1,031 to 1,314, *i. e.*, by only 27 per cent. The notable increase when compared with the figures of 1911 observed, is among Izhavas 700 per cent., Nairs 180 per cent. and Indian Christians 105 per cent. while Nadars and Saliyans have entered the field only in this decade.

214. Distribution of Adult Women and Children.—The number of adult women, male children and female children employed in all the industries was 3,954, 1,846 and 1,672, respectively. The number of adult women bears a proportion of 399 to every 1,000 adult men while the number of children of both sexes bears a proportion of 268 to every 1,000 adult men and women. Children and women are chiefly employed in the industries of Growing of special products (tea and rubber) and Textiles and to some extent in Glass and Earthenware and Metal industries. Taking the figures for the industries employing 20 or more hands, it is seen that while in 1911 the proportion of adult women to 1,000 adult men was 283 and that of children of both sexes to 1,000 adult men and women was 268, in 1921 the proportions stood at 392 and 245, respectively. These figures indicate that in 1921 women were more and children less employed than in 1911.

215. Power Used.—Of a total of 327 industries, mechanical power is used only in 113 as shown below :—Steam in 33, Oil in 29, Water in 7, Gas in 22, Electricity in 14 and combinations of the above in 8. Taking the industries in the order of group, 63 establishments in the Growing of special products, 11 in Chemical products, 10 in each of the Textiles, Glass and Earthenware industries, 6 in Food industries, 5 in each of the Metal industry and Industries of luxury and one in each of the Wood industry, Construction of means of transport and communication, and Production, application and transmission of physical forces, are worked with power. Of the industries employing 20 or more persons, it is seen that in 1911, 63 were worked by mechanical power while in 1921, the number was 100. In 1911, Electricity was used in 4, Steam in 29, Water in 6 and Gas in 1 and combination of these in 14, while the figures under the corresponding heads for 1921 were 14, 38, 23, 5 and 20. The total horse power used in the several industrial establishments of the State was 3827 and the total number of looms in operation 702.

SUMMARY AND SUGGESTIONS.

216. Summary.—Beginning with the population enumerated, it is found that in the last 3 censuses, in which the enumerations were conducted by 3 different agencies, there has been an uniform increase in population of between 15 and 17 per cent. The increase has therefore to be taken as normal and as the result of the improvement in the state of public health and in the material prosperity of the people. The number of towns and the population therein have increased during the decade and the rate of increase in population is more in towns than in villages, indicating that people are leaving agriculture in villages and moving to towns to take to industrial pursuits. The intensely home-loving characteristics of the Indians and religion among the Hindus are said to be the causes for the small volume of migration among Indians. But they do not seem to be the chief ones. That the absence of opportunities and facilities and want of incentive for migration are the root causes for the limited volume of migration, is proved by the fact that a large number of persons had gone to Mesopotamia even during the disturbed state of the country on account of the war when they had been offered employments slightly more remunerative than those which they could obtain here. Hinduism is the predominant religion of the State, and Christians have increased very rapidly contributing to a fourth of the christian population of India. The increase in the general population is caused not by increased production but by diminished wastage, *i. e.*, not by a high birth rate but by a low death rate. This is a most satisfactory feature and is an indication of the advancement of the people. Both in birth rate and infantile mortality there has been a fall in the decade. The proportion of females has been decreasing from Census to Census. It is found by a special enquiry carried out on a large scale that the vitality of mothers has a direct bearing on the sex of children born and that female children increase as the vitality of mothers diminishes. The marital condition has been changing and the number of marriages particularly those of infants has been decreasing. Education has advanced by rapid strides both among males and females and the advancement is shared by all religions. The number of schools and school-going

children shows remarkable increase. The State occupies in the matter of Public Health, Education and Communications (roads) a very high place in India. The language of the country is Malayalam and is spoken by a large majority of the people. Literacy in Malayalam has also doubled itself during the decade. The number of books, periodicals and newspapers has considerably increased. All the infirmities show increase more as the result of accurate enumerations than of any actual rise in their incidence. But the large increase observed in blindness among persons of school going age and particularly among females, demands consideration. The caste system obtaining among the Hindus is the result chiefly of socio-political conditions of the people and when changes take place in those conditions, as was the case during the decade, corresponding changes in the caste system also necessarily follow. The condition of the untouchables has much improved and distance pollution has practically disappeared. The report ends with the consideration of the occupation of the people. People are leaving agricultural occupations, particularly those connected with paddy cultivation, and resorting to the cultivation of commercial crops and to industry and trade. The appendices show that the condition of cattle has been deteriorating, that demand for labour has been increasing and is not being sufficiently met and that children are put to schools largely instead of being sent to work. The volume of internal trade, the value of transactions in markets and lastly the average value of property owned by people have been enquired into and estimated.

217. Suggestions for the Future.—The report not only sets forth the conditions, economic, social, etc., of the people, but also indicates suggestions for the future, tending to the improvement of their conditions, and it is necessary, nay, even expected that they should be noticed. The increase in population is found to be the result of lowered death rate which stands at 20 per mille. Though this is the lowest rate in India, still it admits of further reduction. As spread of education and postponement and limitation of marriages result in a diminished birth rate, all deaths from preventible causes should be stopped to ensure the preservation of the race. Though it may not be possible to bring the death rate to the irreducible minimum of about 9 per mille and thus to increase the span of life to 120 years, the limit of human life according to Western and Eastern beliefs, nor even to prevent premature and still births by the institution of maternity allowances, free examination of women for constitutional diseases, etc., now in vogue in European countries, it is at present within practical politics to reduce the death rate to 14 or 15 per mille, the rate obtaining in the Western countries, by reducing the number of deaths from preventible diseases. For this purpose, Public Health in Municipal towns should be improved on sound and well-directed lines, populous Villages should be provided with Conservancy staffs, Vital Statistics registration particularly in rural areas should be improved and Markets in this State which are very numerous unlike in other parts of India, and which on account of the large number of persons that collect there, form the chief source of infection and means of the spread of infectious diseases, should receive attention in respect of their sanitation and control. Medical inspection of School children and arrangements for the provision of midday meals to poor students for whom it is inconvenient to go home for their meals and return during the interval allowed for tiffin, have become necessary. The need for improvement of agriculture and industries demands early attention. The output of home grown paddy, in spite of the increase in the area brought under cultivation and the extension of irrigation facilities, has been going down chiefly on account of the scarcity of and difficulty in securing the usual green leaf manure, the deterioration of cattle, the chief motive power for cultivation and the dearness of manual labour. The time has come for this State, as in other progressive countries for the replacement and supplementation of manual labour by machinery. Before its introduction and as preliminary to it, the chief obstacles standing in its way, *viz.*, the smallness of the size of the holdings and their fragmentation, require removal. This can be done only in the next Settlement operations, by taking measures for the consolidation and adjustment of holdings. Investment of capital and organised working have to be encouraged and

helped by co-operation. As sufficient land fit for paddy cultivation is available in the State, it only requires intensive cultivation on improved methods to produce sufficient quantity of food stuffs to satisfy the needs of the people. Lastly an up-to-date Department of Statistics has become a *desideratum* and it must be entrusted with the undertaking of the decennial Census operations. In the interval, it will have to take economic survey of certain typical villages in the State and collect and publish annually all kinds of statistics, agricultural, industrial, commercial and vital.

APPENDIX I.

NON-FACTORY OR COTTAGE INDUSTRIES.

Nature and Scope of the Enquiry.—For the Factory Industrial Census, only industries conducted in establishments employing 10 or more persons were taken. As, in Travancore, like the rest of India, there are very few factories employing large number of persons, and as a great majority of the industries are conducted at home, it was thought necessary to enquire into the condition of home-industries. The term 'Industry' is employed in its comprehensive sense of 'productive occupation, agricultural or non-agricultural.' Special schedules, with instructions for filling them in, and a list of industries as given in Statement I appended hereto, were drawn up and the work of conducting the enquiry and filling in the schedules was entrusted to the enumerators appointed for the preliminary enumeration. The non-factory industrial schedules contain more columns than the ordinary Census schedules, and enquiries have to be made under each column in more detail than they are required in the preliminary enumeration. To do this work along with the preliminary enumeration is not, therefore, a satisfactory procedure. This work has no imperial concern; and as it is not possible to bestow as much attention and care to it as are paid to the Census proper, within the limited time allowed, the figures collected cannot be complete and accurate. Under the existing organisation, there is no better way of doing the work, but, when a permanent Department of Statistics is organised, the work could be entrusted to it to be done during the intercensal period. Several Industries such as pounding of rice, making of *pappulams* and beaten rice, cultivation of betel vines, market gardening, manufacture of copper and brass vessels, etc., have not been enquired into and Statistics collected. The figures collected are therefore taken as a basis—rather an apology for it—and they are largely supplemented by information gathered from other sources.

2. Paddy.—Paddy is the staple article of food of the country. Its output is found sufficient to meet in full the demand of only about 40 per cent. of the population. The average annual quantity imported during the last decade was sufficient to satisfy the needs of about 10 per cent. of the people. The remaining 50 per cent. have had to be satisfied mainly with tapioca. From the average yield per acre, the paddy produced in the State comes to 4,08,856 tons. At Re. 1 and annas 4 per para, the value of the total output works at Rs. 71,549,000. Unlike in other parts of India, fish and jack largely enter into the dietary of the people here.

3. Pepper.—Pepper, with cocoanut, contributes chiefly to the wealth of Travancore. The area under pepper cultivation is 48,763 acres. Besides this, in the gardens of almost all houses in the Central and North Travancore and in some of the tea estates, the vine is grown. The total output is found to be 40,690 candies. Of this, 39,355 are exported and the balance is consumed locally, and their total value amounts to Rs. 14,069,000.

4. Ginger.—This is largely used by people here; and its dried variety forms one of the ingredients of the 'Chukku Vellam' (water in which ginger is boiled) used by people for drinking, in the place of ordinary water, which, in the porous laterite soil of the State, is liable to contamination. The fundamental object of using the preparation does not seem to be so much to get the benefit of the action of the ingredient itself as to ensure the boiling of water; and, since, to the ordinary people, the importance of removing contamination by mere boiling would not appeal, the preparation of chukku vellam seems to have been prescribed. Similar practices are said to be obtaining in other parts of India and in other countries. The total quantity of ginger produced in the State is estimated at 102,963 cwts. of which 81,547 cwts. are exported. The total value comes to Rs. 1,588,000.

5. Tapioca.—Tapioca, the cultivation of which was introduced in the State by one of the scions of the Royal House, finds favourable ground in the un-irrigated poor laterite soil which predominates in the State. As its cultivation is cheaper and less troublesome than that of paddy, people have taken to it largely. It is gradually replacing paddy and is grown in quantity sufficient to meet fully the needs of about half the population. It is cultivated on an area extending over 404,100 acres. The yield, on an average, comes to 2 tons per acre and the total annual output for the last decade might be valued at Rs. 30,172,000.

6. Coconut and Oil.—"Kerala" in which is included this State takes its name from "Keram" (Coconut) the chief product of the country. The two banks of the Backwaters which extend from north to south along the coast afford favourable soil for its cultivation. Almost every part of the tree has its use. The nuts take the place of milk in the dietary of the majority of the people. The oil is used for cooking, anointing and lighting. There are very few houses in the State which do not grow coconut in the gardens attached to them. Besides, 456,000 acres of land are used solely for its cultivation. Excluding the nuts, oil, copra and *punnac* valued at Rs. 361,372,000 and exported, the price of coconuts locally consumed as nut and oil comes to Rs. 32,841,000.

7. Coir making.—Making coir from coconut husks is the chief occupation of the Izhavas, who are said to have brought into this State from Ceylon coconut and its cultivation. The fibre and yarn are made in cottages. Matting and mats are manufactured in factories. Most of the houses in the State being thatched ones, a very large quantity of yarn is used for thatching. Leaving a margin for wastage, the coconuts produced in the State are estimated to yield 1,280,947 cwts. of coir, and the value of the yield, excluding that of fibre, mats and matting exported, works at Rs. 19,214,000.

8. Toddy.—Intimately connected with coconut comes toddy, for the tapping of which about 63,262 coconut trees, excluding 11,787 palmyras and 17,716 sago palms, were leased out in 1921. The value of toddy produced from these trees and consumed by the people works at Rs. 2,087,000. The occupation of toddy drawing which was chiefly confined to the Izhavas and Shanars of the State is losing its prestige as the result of the anti-drinking agitation, and these castes are gradually withdrawing from it. The trees leased for tapping which would have yielded wholesome coconuts, to the value of Rs. 81,000, yields unwholesome and noxious toddy to the value of Rs. 1,215,000, *i. e.*, 15 times the value of coconut. !!

9. Jaggery and Molasses.—Making some allowance for the quantity used by the people who take coffee and tea, the whole of the palmyra jaggery or Karuppatty and molasses produced in the country is exported, and they may be valued at Rs. 1,500,000. Karuppatty is manufactured from sweet toddy for which 11,787 palmyra trees were leased out in 1921.

10. Mats, Baskets and Thatches.—Mats are made of different substances for different uses in different places. In South Travancore, they are made of grass and palmyra leaves, those made of the former being used chiefly for bed and those of the latter for packing. In Central Travancore, mats are made of screw pine leaves and used for bed. In the mountainous regions bamboos are utilised for making mats, baskets and boxes and cane is used for making boxes and chairs. Thatching for houses is made mostly from coconut cadjans and to a small extent, from palmyra leaves. As the majority of houses, particularly in the rural areas, are thatched ones, the quantity of thatching required is enormous and is wholly met by the coconut and other palms of the State. The value of these industries works at Rs. 10,474,000.

11. Arecanuts.—Arecanuts are largely consumed in the State. Unlike those on the other side of the Ghauts who chew only dried nuts with betel, the people here use ripe fresh nuts which are also preserved in water. The unripe fruits are

cut and dried and exported and the value of the exports alone is Rs. 564,000. The value of the total yield may be estimated at Rs. 920,000, calculating from the number of trees in the State.

12. Pottery, Bricks and Tiles.—The clay available in the country is not suitable for making pots used for household purposes. The pots made here are heavy. Lighter and more durable ones are imported from the Tinnevely District. The roofing and flooring tiles are chiefly manufactured in factories of which there are large numbers in the State. The fine clay in the beds of some rivers and lakes forms a good material for making high class tiles. Besides the big factories, there are several kilns in the State where bricks and inferior kind of flooring tiles are made. No correct figures are available for them. Except the walls of fishermen huts which are generally built of sandstone or bamboo thatches, the walls of the houses of other people are made of either mud, laterite or bricks. Fireburnt bricks are coming into common use in the construction of houses of well-to-do persons. The value of pottery, bricks and tiles may be put down roughly at Rs. 500,000.

13. Leather Works.—Except for making sandals used chiefly by persons in South Travancore and for harnesses, leather is not of much use in the State. People in the northern parts of the State use wooden sandals. Almost all the available skin and hides are exported and the value of the export is Rs. 181,175. Setting the value of locally consumed leather at Rs. 20,000, the total value of leather produced in the State comes to Rs. 201,175.

14. Dairying.—As stated elsewhere, cocoanut is used in the place of milk and its products. The condition of cattle in the State is unsatisfactory and that of milch cows more so. The total quantity of milk produced per day is 33,833 gallons, which works at Rs. 5,553,000 per annum. The ghee required is imported. A portion of the available milk is converted into curd and butter. But the quantity so converted is very little.

15. Fishing.—The Sea and Backwaters of the State abound in fishes which largely enter into the dietary of the people. Strict vegetarians are few in the State, and a large majority of the people use fish. The value of fish exported in 1921 was Rs. 1,670,000 and that of the quantity consumed locally may be estimated at Rs. 1,389,000 giving a total value of Rs. 3,059,000.

16. Weaving.—The females of the State, in a large majority of cases, use white cloths unlike those on the other side of the Ghauts who wear coloured ones. The wearing apparel consists of a waist cloth of 4 yards long and an upper cloth. The males also use two cloths but the one for the waist measures about 2 yards. For waist cloths, mulls of foreign manufacture are usually used by well-to-do persons but locally made ones are utilised for upper cloths. Cloths manufactured in the State are exported to other parts of India and to Burma and Ceylon also and the value of the export was Rs. 202,462 in 1921. Besides the piece goods imported by sea for which figures are available in the Trade Returns, a large quantity is obtained from the adjoining districts, for which no complete figures are published. Assuming that the value of goods thus imported equals that of the quantity exported, the value of cloth manufactured in the State for local use may be put down at Rs. 17,825,000. In addition to 354 looms in factories, 6,329 looms are said to be working in cottages. The number is far below the actual.

17. Other Sundry Articles.—Other articles produced here are tamarind, lemon grass oil, etc., and their export value is given as Rs. 10,169,011.

18. Garden Productions.—Several garden products such as yams, bananas, etc., are cultivated and some are also exported to other parts of India. Figures are not available for them. But, from the value of the transactions made in the markets of the State, given in Appendix IV, in which that of pepper, tapioca, cattle and pots are also included, the value of garden products may be estimated at 50 per cent. of that of the total market transactions or Rs. 17,623,990.

STATEMENT I.—*Non-Factory Industrial Schedule.*

Census No. of the house.				No. of the Block.		Description of the industry.		Nature of mechanical power employed, if any and the type of engine and horse power.		Name and caste of the head of each family.		Total No. of persons actually engaged in the industry of that family.				Monthly output in terms of weight, measure or number.		Monthly out-turn in money.		Market for the products.		Source of raw material for the industry.		Agriculture extent of land under cultivation.				Weaving.																	
Name.		Caste.		14 and above.		Under 14.		Monthly out-turn in terms of weight, measure or number.		Monthly out-turn in money.		Market for the products.		Source of raw material for the industry.		Agriculture extent of land under cultivation.		Weaving.																											
Male.		Female.		Male.		Female.		Monthly out-turn in terms of weight, measure or number.		Monthly out-turn in money.		Market for the products.		Source of raw material for the industry.		Agriculture extent of land under cultivation.		Weaving.																											
Wet.		Dry.		No. of country loom with throw shuttle.		No. of new loom with fly shuttle.		Count of yarn used.		Quantity of yarn used.																																			
Acre.		Cent.		Acre.		Cent.		No. of country loom with throw shuttle.		No. of new loom with fly shuttle.		Count of yarn used.		Quantity of yarn used.

Station Date Designation Signature.

INSTRUCTIONS FOR FILLING THE SCHEDULE.

Column 1. Here enter the Census number of the house or building where any of the occupations entered in the list of industries, is followed

Note—Persons working in factories such as oil-mill, cotton-mill, mine, tile-manufacture, etc., where there are more than 10 persons employed, should not be included in this Schedule though they may be living in that house or belonging to it. The names of such persons will be returned in the Factory Schedule.

If a family is engaged in more than one of the productive occupations given in the list all those occupations should be entered in the Schedule *separately*.

Column 3. If in one family, there be persons engaged in different occupations, the name of each such occupation should be entered in this Column one below another, the persons working in each industry being entered opposite to each.

Columns 5 and 6. In the case of the members of the family following different occupations, these columns need be filled up only for the occupation followed by the family head.

Columns 11 and 12. The information under these columns should be ascertained with special care from the party concerned who should be distinctly informed that the object of collecting these particulars is merely one of statistical interest and no other.

The quantity as measured in weight, measure or number, should be entered in column 11, and the money value according to the market rate obtaining at the time expressed in Rupees, should be entered in column 12 Round figures alone need be given.

Columns 13 and 14. The places to which the articles are sent for sale should be entered in these columns.

Columns 15 and 16. The place or places from which the materials for making the articles concerned in the industry are obtained, are to be noted in these columns.

Columns 17 and 18. The extent of the land must be expressed in acre and cent approximately. "Wet" cultivation refers to rice cultivation whether in wet land or dry land. All other cultivations should be regarded as "dry".

Column 21. By "country loom," is meant the non-fly shuttle loom used by professional weavers from time immemorial. How many of such looms are used in each home should be entered in this column.

Column 22. The new loom referred to is the modern fly shuttle loom introduced in recent times, worked in a pit or attached to a wooden frame.

Column 23. "Quantity of Yarn". The quantity should be expressed in weight.

N. B. If column (3) does not contain Agriculture or Weaving then columns 17 and 18 or 19 to 22 need not be filled in.

LIST OF INDUSTRIES.

Agriculture of all kinds (cereals, pulses, cocoanut, arecanut, ginger, pepper, tapioca, cotton, tea, coffee, rubber, etc.); paddy husking; ginning and spinning; oil pressing; fish catching and curing; cattle breeding and dairy farming; working in tiles, pottery and other earthenware; work in coir, hemp, net, sack and fibre industries of all kinds; husking and beating coconuts; furniture and tool making; working in hides, leather, bones and horns; Working in brass, copper, bell-metal, tin, zinc, lead, iron and steel; making of baskets, mats, etc., in reeds, bamboo or rattan, etc.; weaving; jaggery boiling, toddy drawing; sweet toddy drawing; sugar cane pressing; manufacture of sugar cane jaggery commonly called molasses.

STATEMENT II.—*Showing the value of the Products of Home Industry.*

Serial Number.	Item.	Value of the Products in thousands of Rupees.
1	Paddy ...	71,550
2	Tapioca ...	30,172
3	Pepper ...	14,069
4	Ginger ...	1,588
5	Cocoanut and its products and oil ...	32,841
6	Toddy ...	2,087
7	Jaggery and Molasses ...	1,500
8	Coir and Yarn ...	19,214
9	Areca nut ...	919
10	Tamarind ...	750
11	Dairying ...	5,553
12	Fishing ...	3,059
13	Weaving ...	17,825
14	Mat, Thatches and Basket ...	10,474
15	Pottery and Tiles ...	500
16	Skin and Leather ...	200
17	Garden Products ...	17,623
18	Other Products ...	10,109
	Total ...	240,033

APPENDIX II.

CATTLE CENSUS.

Object and Method of taking the Census.—Cattle being the chief motive power in this State for agricultural operations, a Census of Cattle was taken this time along with the General Enumeration, as was done on the last occasion. The Revenue agency in rural areas and the Municipal staff in towns were required to take this Census when they attended to House Listing and House Numbering in connection with the General Census. The work was commenced in August and completed in November, 1920. The results of the Census are exhibited in Statement I annexed.

2. Variation Between 1911 and 1921.—Compared with the figures of the last Census, a decrease of 7 per cent. is observed in the total number of cattle. Deducting the number of sheep, cows, calves and she-buffaloes which are not used for draught, the number of heads of cattle available for agricultural operations was 341,700 in 1921 against 356,482 in 1911, showing a decrease of 4 per cent. There are in the State, according to the latest Administration Report of the Department of Agriculture, 7,443 spring carts and 16,176 loading carts. The spring cart bulls are not generally used for ploughing though, in most cases, loading cart bulls are so utilised. Taking that 25 per cent. of the latter and the whole of the former are used for carts alone, the number actually available for ploughing comes to 318,276. The *cherikal* and *kayal* reclaimed lands are not generally ploughed, but 236,169 acres of wet lands in the State are cropped twice in a year. Setting one against the other, the extent of land requiring ploughing works at 648,610 acres. The heads of cattle available for ploughing are only 318,276 giving, on an average, one pair of bulls for 4 acres. The Director of Agriculture states that 3 pairs of bulls, each working for 5 to 6 hours a day, are required for ploughing once one acre of land, and that 6 to 8 such ploughings are necessary for sowing. Taking one month as the period within which the ploughing has to be completed, for 4 acres of land, 3 pairs of bulls are necessary, and the number available in the State is just below one-third of what is actually required. In Madras, one pair of bulls is required for ploughing 4 acres of land, but the fields are not ploughed 6 to 8 times. Coming to ploughs, it is seen that, according to the report of the Director of Agriculture, there are 221,218 ploughs in the State. At the rate of 3 ploughs for every 4 acres, the number required for ploughing wet lands is 486,457. The number available is thus appreciably below one-half of the actual requirements.

3. Cows, Sheep and She-Buffaloes.—The fall in the number of cows, she-buffaloes and sheep amounts to 37 per cent. It is doubtful whether the number of sheep and goats counted in this Census is correct as it is extremely low. Though cows, she-buffaloes and sheep are not required for agricultural operations, their droppings are extensively used as manure and the fall in their number has thus a detrimental effect on agriculture. In the absence of provision in the waste land rules previous to 1921, for the reservation of lands on the borders of paddy fields to plant and grow trees, the green leaves of which are used as manure, much difficulty was felt in the decade under review for procuring sufficient manure leaves and this had contributed partly to the fall in the yield of paddy. The deficiency in cowdung was another important cause for the fall.

4. Milk Supply.—Cows and she-buffaloes chiefly supply the milk required for the people. Assuming that one-third of their number is old, or young or sterile and half the remaining is dry, the number of milking cows and she-buffaloes may be put

down at 111,824. Taking that each cow yields one edangali (two-sevenths of a gallon) and each she-buffalo 2 edangalies (four-sevenths of a gallon) of milk per day, the total quantity drawn in a day is about 33,833 gallons; and, if, with this quantity, the whole population has to be served, each person will get about one and a half ounce of milk per day, while, in India, one-fourth pint is available per head in place of 2 pints actually required for Indians, whose diet consists chiefly of vegetables. But, as in this State cocoanut takes the place of milk and its products supply the wants of the people, the majority are not very particular about milk. Further, it is only for rice food, milk and its products are needed, and as tapioca is largely used in this State in place of rice, the necessity for milk is not much felt.

5. Breeding and maintenance of Cattle.—The Director of Agriculture reports that deterioration of cattle in the State is due to the want of natural fodder and the indifference on the part of the people in the matter of maintenance and breeding of cattle. All the Tahsildars and Municipal Presidents who were asked to enquire about the condition of cattle have also expressed similar opinion and there can be no doubt about its correctness. But they are only immediate causes and they do not take us any further than from where we were before. The root cause must be searched for and enquired into, and the reasons for the indifference of the people in this respect should be traced. It can only be due to the absence of need for investing money on the purchase of cattle and maintaining them. It has been already pointed out, that the demand for milk and its products is not so pressing here as in other parts of India, inasmuch as cocoanut serves the purpose of the milk. As stated in a previous chapter, tapioca is extensively cultivated in the State and is replacing rice among the poorer classes. The poor and unirrigated soil in the State is suitable for the cultivation of this crop. Unlike in the case of paddy, ploughing is not indispensable for the cultivation of tapioca. The necessity, therefore, of investing capital for the purchase of cattle and maintaining them throughout the year, though their use is actually required only for about 3 or 4 months in the year, does not arise. The chief fodder for cattle is paddy straw, and, unless paddy is grown largely, there will not be much of straw. Paddy cultivation and cattle breeding are thus inter-dependant, and the fall in the one causes the fall in the other.

6. Statistics of the Agricultural Department.—The statistics of animals treated in Veterinary Hospitals, the number enumerated, etc., as compiled from the figures given in the Administration Report of the Agricultural Department are exhibited in Statement II annexed hereto. It will be seen therefrom that, there is appreciable difference between the number given in the Census returns and that furnished in the Administration Report. But, as in the report, calves are not shown separately from cows and buffaloes, it is not possible to say where the difference is great. Further, the figures for the Administration Report were collected at the end of the year, while the Cattle Census was taken at the beginning, and this may in a way account for the difference. The decrease observed in the number of sheep and goats censused, as compared with their number in the Administration report, is too great to admit of any proper explanation. For 8 years in the last decade, some disease or other had been prevailing in an epidemic form, causing mortality among cattle, and this might have partly contributed to the fall in their number.

7. Veterinary Hospitals and Cattle Farms.—The number of institutions for treatment of diseases among cattle rose from 3 at the beginning of the decade to 11 at its close. On an average, 6,580 animals have been treated per annum. The number of farms where experiments and demonstrations of cattle breeding are conducted rose from 1 in 1911 to 3 in 1921. It is said that arrangements have been made for awarding grants to private persons for good breeding and proper maintenance of cattle and that the people are evincing interest in the work. The results of the steps taken can be treated only in the next Census Report.

APPEND 1X. III.

LABOUR CENSUS.

Necessity for the Census.—The decade under review is characterised among other activities, by rise in the price of articles all round which has affected labour considerably. In order to find out the distribution of labour among the several departments of human activities and to collect information on the material condition of labouring classes, the present enquiry was instituted. The enquiry to be useful and satisfactory should be made leisurely during intercensal period and not hurriedly along with the populational Census and intensive study should be made of certain establishments. However, recognising the importance of such an enquiry, a first attempt was made towards it with the information made available at this Census.

2. Scope and Nature of the Enquiry.—In order to collect information from all sources which employ labour, the Managers of Factories employing more than 10 persons, the Tahsildars, the Presidents of Municipalities and the Heads of several Departments where labour is employed, were requested to supply information in schedules specially drawn up for the purpose. The enquiry was required to be made under ten main heads, and, under each head, were given the points on which information was to be collected. The main heads and the questions under each, are as follows:—

I. Description and Name of Establishment.

II. Operatives.

Total No. Male, Female, Hindu, Muhammadan, Christian, Others, Travancoreans, Outsiders, Skilled, and Unskilled.

III. Whether employment is permanent, seasonal or periodical in each case.

IV. Demand for labour.

1. Is there any increase or decrease in the demand for labour during the decade?
2. For what kind of work is the labour in much demand?
3. Is the demand met adequately?
4. What are the hours of labour?
5. Is there any attempt to reduce the number of working hours?

V. Density and overcrowding in cooly lines.

1. Are there separate quarters for the coolies?
2. What is the area of each house on an average?
3. How many rooms are there in each?
4. Are there separate rooms for males and females?
5. How many persons live in a house?

VI. Condition of female labour.

1. Type of women employed.
2. Kind of work done by them and hours of work.
3. Arrangements made regarding maternity.
4. Birth-rate among women.
5. Comparative rates of wages among men and women.
6. How far are women replacing men in different industrial occupations?
7. Social position and reputation of female workers.

VII. Influence of Caste and Religion on industrial development.

1. The effect of industrialisation,
 - (a) on caste feeling,
 - (b) on the mode of life, and
 - (c) on character and employment of leisure.
2. The extent to which the industrial classes retain their traditional occupation.
3. The social position of factory workers, compared with home workers (as shown by changes of custom, formation of sub-castes, intermarriages, etc.).

VIII. Movements of Labour.

1. Are there any movements of labour from one particular place to another particular place?
2. Whether the movements are seasonal, periodical or permanent.
3. How far the movements respond to the varying demands of employment?
4. How far are they spontaneous and how far are they the results of organization or recruitment?
5. What are the general conditions under which the recruitment takes place?
6. The extent to which the labour is permanently or temporarily attached to any particular contractor and the general efficiency of this form of organization.

IX. Rise of Wages.

1. How far is there correspondence between wages and prices?
2. What is the effect of the rise in wages on the conditions of industry and the general economic condition of the labouring classes?
3. To what extent has this increased prosperity of the labouring classes tended to raise their standard of life and improve their general condition?
4. To what extent has the surplus been devoted to the improvement of their mode of life, the education of their children and so forth?
5. To what extent has it resulted in a desire to better themselves or their children by exchanging their present occupation for cultivation or some other more ambitious form of livelihood?

X. Labour organization.

1. Has there been any strikes in the establishment during the last decade; how many times and how often?
2. Is there any organization of labour and if so, is it permanent and likely to spread?
3. Where is the seat of authority and to what extent does the motive power come from within or without?
4. Do these organized movements of labour react in any way on the structure of caste and are they influenced by caste sanctions?
5. Do they tend to strengthen or relax the bonds of caste and if the latter, to what extent does the domination of caste give way to new authority?

Out of a total of 327 factories which employ 10 or more hands, only 313 returned the schedules completely filled in. In some schedules several questions were left unanswered, and, in others, the answers given were contradictory to one another. The result cannot, therefore, be considered satisfactory, but it can be taken as showing the general trend of the economic condition of labour.

3. Description and Name of Establishment.—According to the schedules received the number of operatives was 45,997 (males 31,684 and females 14,313). Of these 22,746 were skilled and 23,251 unskilled. The number of Travancoreans among them was 32,013. The employment was permanent in 309 and periodical or seasonal in 4.

4. Demand for Labour.—The increase in the demand for labour is universal. It is satisfactorily met in the tea and rubber estates of the hills where employment is permanent and where labour is recruited chiefly from outside Travancore. In the plains and in the institutions where the establishment is periodical, difficulty is experienced in meeting the increased demand. The hours of labour are, in the hills from 6 A. M. to 4 P. M. with a recess of half to one hour, and, in other places, from 7 A. M. to 5 P. M. with a recess of an hour in the afternoon. There is no attempt to reduce the number of working hours except in temporary employments in plains where labour turns up for work rather late in mornings.

5. Density and Overcrowding in Cooly Lines.—Except in the tea and rubber estates in the hills, where coolies are recruited mostly from outside the State, no accommodation is provided for them. In the cooly lines of the estates, each room measures on an average 12 ft. by 10 ft. with a separate kitchen, in most cases; and two families are accommodated in it. Taking 3 as the lowest number of members constituting a family, 120 sq. feet are available for 6 persons, *i. e.*, 20 sq. ft. for each.

6. Condition of Female Labour.—Most of the unskilled operatives are of lower classes of society. All kinds of work which do not require muscular energy are done by women, particularly those which are tedious and require sustained labour, such as weeding, plucking, etc. The hours of attendance are the same for both males and females. The wages of females in the tea estates are regulated by the quantity of work turned out by them and they sometimes earn more than males. In the tea estates of the hills, males are given on an average 6 annas per day and females 4 annas; but they sometimes earn 12 annas to 1 rupee per day. In the plains and in temporary employments, the wages for males vary from 8 to 12 annas and for females from 4 to 6 annas. The reputation of the women is reported to be satisfactory on the whole. In the tea and rubber estates, where coolies live, Medical Officers attached to those estates, attend on the women during confinements. But there are no female doctors or midwives. In a large number of cases the women are said to go to their homes for confinements. They are given in some estates cooly allowances for two weeks after delivery.

7. Influence of Caste and Religion on Industrial Development.—The caste feeling is gradually wearing away among the workers, although no appreciable change is observed on their mode of life. There is not much of leisure for them, but in the few cases in which there is leisure, it is employed for the enhancement of their income by taking up other work. Traditional occupation is not scrupulously adhered to. Whatever work is possible to be done is taken up. The social position of factory workers, particularly of those who live in the factory and of those who go out of the country, is looked down upon by home workers. The former form themselves into separate sub-castes and intermarry. But the influence of wealth goes a great way in all these matters.

8. Movement of Labour.—The labour for the estates in the hills are mostly from the neighbouring British districts. For temporary work in the plains, the labour is chiefly recruited from villages adjoining the place of work, and it is voluntary and spontaneous. There is no organisation. Each contractor knows some coolies who work under him. In the case of labour recruited for work in the tea and rubber estates in the hills, the recruitment is made by *Kanganies* who advance money to the coolies to meet their urgent wants, to purchase new clothes and to spend a little for drink also. During their stay in the estates, they pay off the debts and return home with

little or no savings to be recruited again under similar conditions. The coolies themselves are in a chronic state of indebtedness. Their relation to the *Kangani* is not one of love or affection but is that of a debtor to a creditor. Agreements are also sometimes taken stipulating the conditions under which coolies are to work.

9. Rise in Wages.—On account of the rise in the price of food stuffs, the wages have also risen; but it is perceptible only in the case of the free labourers in the plains. In the tea and rubber estates of the hills, where coolies are given advances and brought to work to clear off the debt, the effect of the increase in the wages is not much. The rise in wages has to some extent prejudicially affected the condition of industry, although the economic condition of the labouring classes in the plains has improved a little. The labouring classes who are thus benefitted by the rise in the wages clothe themselves better and educate their children. The rise in wages has benefitted only skilled labourers and *Kanganies*. These people invest their savings in purchasing lands.

10. Organization of Labour.—One case of strike was reported in one of the factories, and it lasted for 3 days. There is only one labour union in the State.

APPENDIX IV.

INTERNAL TRADE AND MARKETS.

Scope of the Enquiry.—Travancore is peculiar in possessing a large number of markets. There is no village in the State but has a market, in which the chief commodities produced in the neighbourhood are brought and sold. To ascertain the value of trade, 117 important markets were selected and enquiries were made in respect of them by Tahsildars and Presidents of Municipalities who were required to note the information collected in special schedules prepared for the purpose. The schedules contained the following columns :—

1. At what intervals the market is held?
2. The number of times the market is held in a year.
3. What are the articles sold in the market and by whom?
4. Where do the articles come from?
5. How far do the bazaars of the place supply the wants of the people?
6. How far are the bazaars and the markets interconnected or complementary?
7. How far are prices governed by custom or competition?
8. What new commodities are being brought and sold and where do they come from?
9. What is the average turn-over of different classes of shop-keepers?
10. What is the total amount of transaction in rupees of the trade on each day of the market and the total for the year?
11. How far credit advances and payment in kind are allowed?
12. How is the relation between the small shopkeepers and the large wholesale dealers?
13. To what extent trade agents are employed?
14. How far custom and clientele is regular?
15. What sorts of stocks are kept?
16. What sort of accounts are kept in petty shops?
17. Are there any dealers who import goods direct from countries outside India, and if so, how many?
18. How many dealers get their stocks from outside Travancore but within India?

2. The Number of Markets from which Schedules were Received, their Classification etc.—Of the total number of markets, 26 are daily, 15 are weekly, 62 are bi-weekly, 3 are tri-weekly and 11 are occasional. The articles sold in the markets except in fourteen of them where cattle alone are brought for sale, are chiefly the agricultural products of the country. The cattle for the Monday market at Eraniel and Vadderi are brought from outside Travancore. Earthen pots are also brought from places outside the State. The bazaars supply the ordinary wants of the people and they recoup their articles from markets. The price is governed by competition and varies according to the availability or otherwise of the the articles sold.

3. The Amount of Transactions.—It is not possible to give the average turn-over of the different classes of shop-keepers. The total amount transacted in markets comes to about Rs. 35,247,980 in a year. No credit is allowed in markets and payment is generally made in cash.

4. Shops and Bazaars.—Large wholesale dealers give articles on credit to small shop-keepers. Trade agents are not usually employed. The small shop-keepers are generally attached to their wholesale dealers and do not change them. All sorts of unperishable articles are kept in stock. In petty shops, no accounts worth the name are kept. In big towns like Alleppey, Quilon, and Trivandrum there are a few dealers who get their stocks from abroad, particularly, rice from Burma and piece goods, machinery, etc., from Europe. The number of such dealers comes to 27 in all. About 736 merchants get their stock from outside Travancore, chiefly from Cochin, Madras and Bombay.

APPENDIX V.

THE ECONOMIC CONDITION OF THE PEOPLE.

General.—The general Census, as taken in India, supplies information about the growth, civil condition, education, infirmities and occupation of the people. The special Censuses taken this time along with it in the State, give the condition of labour, the volume of internal trade, the condition of cattle, the nature of cottage industries, etc. The most important of the Censuses, *viz.*, the Census of the Economic Condition of the people, still remains to be taken. It is not possible to take this Census satisfactorily along with the other Censuses, but it has to be done leisurely in the intercensal period. Two methods generally adopted in taking the Economic Census are, the intensive and the extensive method. The first is more reliable than the second. For the first, typical villages are taken and a regular economic survey is made. Dr. Slater has made such a survey in Madras, Dr. Mann in Bombay and Mr. Jack in Bengal. No such attempt has as yet been made in Travancore. The average income of a family and its savings can be correctly ascertained only by economic survey of typical villages. From the figures collected in the general and special Censuses an estimate, necessarily a crude one, is formed of the value of property owned by private persons and of the trend of the economic movement in the State. The attempt being the first of its kind, it is needless to say that the result obtained will lack in the required accuracy. But, it cannot be doubted that it has its own value.

2. Data required for estimating the value of Property owned by the people.—In the Census of the United States of America, the value and extent of agricultural holdings, the rate and quantity of yield, the capital invested in manufactures, etc., are collected; but no such information is gathered in Indian Censuses. The line followed here in estimating the value of property owned by people is similar to the one adopted in the United Kingdom in 1910. In making the calculation, the value of the forests owned by the State, Government buildings, Railways, etc., have been left out. The information required was taken partly from the Statistics of Travancore, partly from the special reports received from Departmental Heads and partly from private enquiries. In the annexed statement I, are given the details of the several items which contribute to the property of the people. It will be seen there from that, taking a family consisting of 5 persons as the unit, each family owns property to the value of Rs. 1,990 or Rs. 2,000 in round numbers. In the United Kingdom in 1910, each family owned property worth £ 1,550.

3. The Trend of the Economic Movement.

CENSUS.	PROPORTION OF		Population in millions.
	Males.	Females.	
1851	23.5	2.4	17
1861	21.2	1.5	20
1871	16.8	1.0	22
1881	13.8	0.6	26
1891	11.6	0.4	29
1901	9.5	0.3	32
1911	9.2	0.3	36

Advancement of human society is possible only by the liberation of men from work in lower spheres, which can be done by machinery, and the utilisation of their services in higher spheres, and giving them leisure to rest, study and think. "The truth is that the less labour is needed for any particular kind of work, the more labour is set free to do other work. This is an universal law of nature and there can be no exception to it." The liberation of man's hands from the purpose of locomotion, the erect position attained, the pose of his head upon his erect spine assisting him in his survey of the world, and the extension of his horizon have made him a giant in comparison with his nearest relatives. Taking agriculture which intimately concerns the people of the State, it is admitted that cultivation of paddy leaves very little margin of profit, and that, with the profit so obtained, it is impossible to meet the increasing expenses incidental to the present day standard of living. The number of persons who are engaged in agriculture is therefore gradually diminishing, as is the case in all other countries, particularly England. The proportions

of males and females over 10 years of age to 100 of the total population over 10 years, in each sex, engaged in agriculture in England and Wales in the last seven successive Censuses are shown in the margin. That the decrease in number engaged in agriculture has not in any way affected the extent of area under cultivation, the quantity of yield or the increase in population will be observed from the fact that, while the average extent of land cultivated during the 10 years ended June 1914 was 1,868,000 acres, it stood at 1,962,000 acres in June 1920, and, while, the average yield of wheat in the period 1855-1894 was 29·32 bushels per acre it rose to 30·75 bushels in 1911-1920. The population had increased by over 100 per cent from 1851 to 1911. "As soon as science touches farming, the proportion of agricultural labour in a country must fall. This is a social fact of the first importance the bearing of which is as yet scarcely realised. "It is a good thing and not a bad thing that agricultural work is an ever-diminishing factor in the world in proportion to the aggregate amount of work done." Even in Travancore, the number of persons engaged in the cultivation of paddy has decreased while the population and the extent of area under paddy cultivation have increased.

4. Extended use of Machinery needed.—The introduction of machinery is confined at present, only to the draining of water from *Kayal* re-claimed lands, and it has not caused any dislocation of work by throwing out of employment people using the primitive irrigation wheels. It has been estimated that with the help of modern machinery, 4 men will be able to cultivate and make available at market, distant over thousands of miles, sufficient wheat required for feeding 1,000 persons for one year. Although, in Travancore, it is not necessary to carry rice to markets distant 1,000 miles, still adopting the above rate, the number of persons required to cultivate paddy and make it available for feeding the whole population will be only 16,000. The rice produced in the country is found sufficient to feed only 40 per cent. of the people; but if the area now under cultivation of paddy be properly cultivated, the rice-output may be made sufficient to feed the whole population. The number of persons actually engaged in the cultivation of paddy which would feed only 40 per cent. of the people is in this Census 409,715 which is 25 times more than what is necessary for feeding the whole population. In England, the number of persons actually engaged in agricultural occupation, works at 1 for 15 acres, while, in America, it works at 1 for 37 acres. In Travancore, on the other hand, one man is actually employed for cultivating one and a half acres. It is believed that the introduction and use of machinery in a land where manual labour is available is disastrous to the people. But, it may be said that, except in the case of primitive people, this does not hold universally true. The Travancoreans are not primitive people. The introduction of sewing machines which is in use in almost every village has not driven out the old tailors but has considerably improved their strength and prosperity. During the decade under review, the Railway and a large number of motor vehicles, cars, buses and cycles were introduced. Still, the number of carts drawn by bullocks and horses had increased from 22,730 in 1911 to 23,619 in 1921. By machine labour, it is not meant here factory labour, as these two do not always go hand in hand. There may be some difference of opinion with regard to the question whether factory labour on a large scale is good and necessary for India; but there can be no difference of opinion at all with regard to the question of the introduction of machinery which will assist or replace manual labour. This not only contributes to a larger output of work but also affords leisure for rest and improvement. Even now, the complaint is that labour is too insufficient to meet the demand. It is true that, at the transition stage, some difficulties may be felt. When the child from the four-footed state of existence tries to get up on its feet, it finds difficulty and tumbles down. At the stage of puberty, some dangers have to be guarded against. Help and advice are required then, and such difficulties cannot be avoided, but must be overcome. Necessity is the mother of invention and evolution consists in the unfolding from within. If there is stimulus from outside there will be response from within. Given the opportunities and facilities for the utilisation of qualities dormant, there can be no doubt about manifestation of those qualities. Travancore is just now at the transition stage. The holdings of wet lands are too small and what is worse is that there is much fragmentation even in the small holdings. These and the want of co-operation and

organisation stand in the way of the general introduction of the machinery in agricultural operations. In the next Settlement, the defects in connection with holdings and fragmentations may be remedied. Co-operation and organisation have to be developed in the meanwhile.

Statement showing the value of Property owned by Private People.

Serial Number.	Item.	Total Value in thousands of Rupees.
1	Wet lands	405,059
2	Dry lands	129,881
3	Garden lands	168,176
4	Occupied houses in towns	72,011
5	Occupied houses in Villages	206,945
6	Shop and Trade premises in towns	9,000
7	Shop and Trade premises in Villages	10,205
8	Tea plants	19,872
9	Cocconut trees	341,978
10	Rubber trees	17,856
11	Pepper vine	12,191
12	Areca, Jack, etc.	50,359
13	Agricultural Live Stock	28,250
14	Ploughs and other implements	1,106
15	Carts, Motor Vehicles, etc.	3,529
16	Motor Boats and Vallams	2,896
17	Furniture and Vessels	46,426
18	Printing Presses and Mills etc.	2,941
19	Investment in Savings Banks	2,921
20	Paid up Shares in Joint Stock Companies	7,398
21	Debenture Loan	1,372
22	Stock in Trade	47,671
23	Life Insurance	200
24	Ropeway, Tramway, Power station and factories	6,281
	TOTAL	1,604,524
	Total Number of Families	801,212
	Average per Family	1,990-0-0

NOTE:—The particulars of calculations are given so that if they are found incorrect, they may be corrected.

NOTE II:—Items 1 and 2—The extent and rate were fixed as per information contained in the Statistics of Travancore regarding Revenue and Registration Departments. Item 3—The extent is fixed at quarter of an acre for houses in the Southern Division and Urban areas and at half an acre for houses in the other Divisions and Rural parts. Items 4, 5, 6 and 7—The number of occupied and unoccupied houses and miscellaneous buildings in towns and villages is that taken in the Census. Houses in towns were valued at Rs. 1,000 and those in villages at Rs. 300 per house. Fifty per cent. of the miscellaneous buildings in the State were taken as the number of shops, one cent of land being given for each shop, and Rs. 2,000 and Rs. 500 being fixed as the value of each cent with the shop building, in towns and villages, respectively. Item 8—The extent was fixed as per information contained in the Statistics of Travancore. The number of bushes was fixed at 3,000 per acre and the total number of bushes was valued at 4½ annas per yielding bush. The rates were those supplied by the Director of Agriculture. Item 9—The area was taken from the Statistics of Travancore. A rate of 75 trees per acre was fixed and they were valued at Rs. 10 per tree, whether yielding or not. Items 10 and 11—The extent was taken from the Statistics of Travancore. The number of rubber trees and pepper vine was fixed at 100 and 250, respectively, per acre and they were valued at Rs. 7 and Rs. 2 per tree and vine, respectively, as per information supplied by the Director of Agriculture. Item 12—The number of trees was taken from the last Settlement Report. Areca was valued at Rs. 2, Jack at Rs. 15, Palmyra at Rs. 1, Punna at Rupee 1, Tamarind at Rs. 30 and Mango at Rs. 10, per tree. Item 13—The number was taken from the Cattle Census. Cows were valued at Rs. 25, bulls and he and she buffaloes at Rs. 50, calves and sheep and goats at Rs. 5, horses and mares at Rs. 200, colts and fillies at Rs. 50 and asses at Rs. 25, per head. Item 14—The number was taken from the Administration Report and each plough with its auxiliaries was valued at Rs. 7 (Rs. 5 per plough and Rs. 2 for other implements.) Item 15—The number was taken from the Administration Report and from information supplied by the Commissioner of Police. Riding spring carts were valued at Rs. 100, loading carts at Rs. 50, Motor Buses at Rs. 10,000, Motor Cars at Rs. 4,000 and Motor Cycles at Rs. 900 each. Item 16—The number was fixed as per information supplied by the Chief Engineer. Each Motor Boat was valued at Rs. 9,000, each Vallam used for traffic and transport of passengers and goods at Rs. 150 and each dug-out used in houses for private persons estimated 20,000 at Rs. 50. Item 17—This was taken as one-sixth of the value of house property. Item 18—The number was taken from the Statistics of Travancore. Each Mill was valued at Rs. 10,000 and each Press at Rs. 5,000. Items 19, 20, 21 and 23—The figures were taken from the Administration Report and the Budget for 1921. Item 22—This is the value of imports of 1921. Item 24. The information was supplied by the Commissioner, Devikulam and the Presidents Municipal Councils of Alleppey and Quilon.

Particulars of Changes made and of Taluks Comprised in the Divisions.

A. ADMINISTRATIVE DIVISIONS.

1. Trivandrum Division (Southern Division).—The old Divisions of Padmanabhapuram and Trivandrum are amalgamated and form the present Trivandrum Division. In it are included the present Taluks of Tovala, Agastiswaram, Kalkulam, Vilavankod, Neyyattinkara, Trivandrum, Nedumangad and Chirayinkil.
2. Quilon Division (Central Division).—To the old Quilon Division are added the Pakuthies of Aryad North, Aryad South and Mararikulam South of the old Shertallay Taluk to form the present Quilon Division. It comprises the present Taluks of Kottarakara, Pattanapuram, Shencottah, Quilon, Kunnattur, Karunagapalli, Kartikapalli, Mavelikara, Pathanamthitta, Tiruvalla and Ambalapuzha.
3. Kottayam Division (Northern Division).—The present Kottayam Division is formed by the inclusion of the Pakuthies of Manimala, Cheruvalli, Chirakkadavoo, Kanjirapalli North, Kanjirapalli South and Poonjar of the old Peermade Taluk and the exclusion of the Pakuthies of Aryad North, Aryad South and Mararikulam South of the old Shertallay Taluk, of the old Kottayam Division. The following present Taluks go to form this Division—Shertallay, Vaikam, Kottayam, Changanachery, Minachil, Muvattupuzha, Todupuzha, Kunnatnad and Parur.
4. Devikulam Division (High Range Division).—The old Devikulam Division minus the Pakuthies of Manimala, Cheruvalli, Chirakkadavoo, Kanjirapalli North and Kanjirapalli South and Poonjar of the old Peermade Taluk form the present Division having as its component parts the present Taluks of Devikulam and Peermade.

B. NATURAL DIVISIONS.

1. Sea-Coast Division.—The Taluks of Agastiswaram, the Erachchakulam Pakuthy of Tovala Taluk the Pakuthies of Aloor, Eraniel, Thalakkulam, Kadiyapattanam, Manavalakurichi, Colachel and Thiruvithamcode of Kalkulam Taluk Vilavankod, Neyyattinkara Trivandrum, Chirayinkil, Quilon, Karunagapalli, Kartikapalli, Ambalapuzha, Shertallay and the pakuthies of Varapuzhai, Kottuvalli, Ezhikkara, Parur, Puthenvelikkara, Vadakkekara and Puthenchira of Parur Taluk.
2. Inland Division.—The Taluks of Kottarakara, Kunnatur, Mavelikara, Tiruvalla, the Vallikode Pakuthy of Pathanamthitta, Vaikam, Kottayam, Changanachery the pakuthies of Ilakkad, Kidangoor and Kanakkari of Minachil, the pakuthies of Kothakulangara, Alwaye and Thrikkakara of Kunnatnad and the Pakuthies of Ayirur, Alangad, Kodungallur, Chengamnad, Parakkadavoo, Edappalli Vadakkumbhagam and Edappalli Thekkumbhagam of Parur Taluk.
3. Mountainous Division.—The Taluks of Tovala (all Pakuthies except Erachchakulam), Kalkulam (all Pakuthies except Aloor, Eraniel, Thalakkulam, Kadiyapattanam, Manavalakurichi, Colachel and Thiruvithamcode), Nedumangad, Pattanapuram, Shencottah, Pathanamthitta (except Vallikode Pakuthy), Minachil (all Pakuthies except Ilakkad, Kidangoor and Kanakkari), Muvattupuzha, Todupuzha, Kunnatnad (all Pakuthies except Kothakulangara, Alwaye and Thrikkakara), Peermade and Devikulam.

TABLE I.

AREA, HOUSES AND POPULATION.

NOTE:— 1. The areas given in the table differ from those in the corresponding table of 1911 Census on the ground that

(a) certain hill tracts, left unsurveyed in 1911 were surveyed since and included in the total area,

(b) the Administrative Division of Padmanabhapuram was abolished and amalgamated with Trivandrum Division under the name of "Southern Division" and

(c) inter-divisional transfers were effected in the areas of Quilon (Central), Kottayam (Northern), and Devicollam (High Range) Divisions.

2. The State is now divided into three Natural Divisions, Sea-Coast, Inland and Mountainous, instead of the two Natural Divisions of 1911, Western and Eastern.

3. The number of villages given in the table, viz., 3,897, is for occupied villages. This is exclusive of the 59 villages included in 19 Census Towns and 8 additional Municipal Towns separately censused during the decade, making a total of 3,956 against 3,955 in the last Census. The reason for the difference in number will be explained in the Report.

4. Two small tracts under British Administration, which are not included in this table lie within Travancore. They are Anjengo and Tangasserri and go by the name of Anjengo District. Its extent and population are:

	Area.	Persons.	Males.	Females.
Anjengo District	One square mile	5,918	2,823	3,095

5. Talukwar statistics of area, houses and population, religion and literacy will be found in Provincial tables I and II at the end of the Volume.

TABLE III.

TOWNS AND VILLAGES CLASSIFIED BY POPULATION.

NOTE:—The Number 3935 shown in column 2 of this Table includes the 3897 villages as per Table I and the 38 Towns of the State.

2. The travellers enumerated in encampments, boats, trains, etc., were excluded from the total population shown in the volumes of Village Statistics before the grouping of the Towns and villages into classes; and their population for each Administrative and Natural Division is shown in the last column of the Table.

TABLE IV.

TOWNS CLASSIFIED BY POPULATION WITH

VARIATION, SINCE 1881.

NOTE :—This Table shows the population of Towns at each of the last five enumerations, and distribution by Sex at the last three.

2. The Towns are arranged in this Table according to their population in 1921 and have been grouped in six classes.

CLASS.	LIMITS OF POPULATION.	NUMBER OF TOWNS.	CLASSIFICATION.	
			MUNICIPALITY.	TOWN.
I.	100,000 and over
II.	50,000 to 100,000	1	1	..
III.	20,000 to 50,000	3	3	..
IV.	10,000 to 20,000	8	8	..
V.	5,000 to 10,000	11	6	5
VI.	Under 5,000	15	1	14
	Total	38	19	19

3. There is no Town in the first class and hence Class I is not shown in the Table.

4. Towns with asterisks are those whose boundaries have been changed since 1911. Additions have been made to the areas of 5 of the towns and reduction made in one town since the last Census. The population as enumerated in 1921, of the areas added to or removed from the towns, is shown below for each.

NO.	NAME OF TOWN.	POPULATION OF THE AREAS.	
		ADDED.	REMOVED.
1	Kottayam	3,045	..
2	Thiruvella	3,001	..
3	Shencottah	1,111	..
4	Kayencolam	187	..
5	Alwaye	1,638	..
6	Parur	..	879

5. The 38 Towns given in the Table consist of 19 Municipalities and 19 Towns. In 1911, there were only 7 Municipalities. Along with them, 4 Conservancy Towns were also separately censused then. These 4 Conservancy Towns and 8 other Conservancy Towns were made Municipalities during the last decade, making a total of 19 Municipalities. All these 19 Municipalities along with the 19 Towns were separately censused this time. For this reason, columns 5 to 13 and 15, 16, 18 and 19 cannot be filled in, in respect of 27 Towns and are therefore left blank.

6. The travellers are included in the population of the town in which they were enumerated.

TABLE VII.

AGE, SEX AND CIVIL CONDITION.

This Table is divided into two parts :

Part I gives the State Summary wherein statistics for all the eight religions returned are given.

2. Part II. deals with the Divisions (Administrative and Natural) and shows figures for the four religions, Hindu, Musalman, Christian and Animist, and for "others" under which are included Buddhist, Jew, Jain and Zoroastrian.

3. In Part I, State totals are given for each year up to five years of age. Thereafter, the ages are grouped into quinquennial periods up to 70; and the remaining ages are shewn as "70 and over".

4. In Part II, figures are given for a less number of age periods viz., 0-1, 1-5, 5-10, 10-15, 15-20, 20-30, 30-40, 40-50, 50-60 and 60 and over.

5. Age periods for which there are no figures are omitted in the Table.

6. The figures for municipalities and towns are not given agreeably to the instructions issued by the Census Commissioner for India.

TABLE VIII.

EDUCATION BY RELIGION AND AGE.

NOTE:—This Table deals with the literacy of the population classified by religion and age. "Literate" includes "Literate in English."

2. Like Table VII, it is divided into two parts:—Part I gives the State total wherein statistics for every religion returned are shown separately. Part II deals with the Divisions (Administrative and Natural) and gives figures separately for four main religions:—Hindu, Musalman, Christian and Animist and clubbed together under "others" for the remaining four minor religions as in Table VII.

3. In general arrangement this Table closely follows Table VII; but only four age periods are given, viz., 0-10 10-15, 15-20, 20 and over.

4. Statistics of literacy in particular Vernaculars have been omitted from the Table and embodied in Subsidiary Table I of Chapter VIII.

5. The following statement showing the general literacy and literacy in English under the several age periods for each of the Races and of main sects of the Indian Christians was prepared as required in the Imperial Code of Census Procedure.

Education among Christians by Race and Sect under several age periods.

TABLE XII.

INFIRMITIES.

NOTE:—This table is divided into two parts. Part I shows the distribution of the persons afflicted according to age and Part II. the distribution according to locality.

2. To the 4 infirmities—Insanity, Deaf-mutism, Blindness and Leprosy—recorded in conformity with those in other Provinces and States, Elephantiasis which largely prevails in this State is added.

TABLE XII.
Infirmities, Distribution by Age.

NOTE.—The number affected with Elephantiasis is not included in columns 2 to 4 "population afflicted".

TABLE XII—A.

INFIRMITIES BY SELECTED CASTES, TRIBES OR RACES.

The Castes selected for the purpose of this Table are those shown in Part I of Table XIII. In the case of the Hindus and Musalmans, only those castes having each a proportion of one or more per mille of the population have been selected, while, in the case of the Christians, Animists and others, no such restriction has been followed.

TABLE XIII.

CASTE, TRIBE, RACE OR NATIONALITY.

NOTE :—This Table is divided into two parts :—

Part I contains the main castes and races under each religion with their distribution by locality (Administrative and Natural Division).

2. Part II gives the particulars of the minor castes grouped under "Others" in each religion in Part I.

3. The instructions of the Imperial Census Commissioner that only those castes whose numbers bear a proportion of not less than one per mile of the total population need be treated as main castes, have been strictly adhered to in the case of the Hindus, with the exception that Malayala Kshatriyas have been treated as a main caste regardless of their numerical strength.

4. The names of the sub-castes that are included under Ampalavāsi, Brāhmin (Malayāla), Brāhmin (Others) and Kammāla, for the purpose of this and other Caste Tables, are given below, with their numerical strength noted against each.

No.	I. Ampalavāsi includes :	Males	Fe-males.	No.	II. Brāhmin include	Males.	Fe-males.	No.	III. Kammālan includes :	Males.	Fe-males.
1	Ampalavāsi ..	597	473		A. Brahman Malayāla.			1	Asari ..	43,127	42,265

TABLE XV.

TERRITORIAL DISTRIBUTION OF THE CHRISTIAN POPULATION
BY SECT AND RACE.

NOTE:—ROMAN CATHOLIC AND ROMO-SYRIAN.—Both are Roman Catholics by faith; and the "Syrian" after 'Romo' indicates that the Roman Catholics referred to are of Syrian social community. The Enumerators do not make such distinction and return one for the other. So, for purpose of comparison the number returned under both "Roman Catholic" and "Romo-Syrian" should be taken.

2. CHALDEAN SYRIAN.—No one was returned under this denomination this time though 1612 were returned in the last census. The chances are that they might have returned themselves either under "Roman Catholic" or "Romo-Syrian".

3. REFORMED SYRIAN AND MAR THOMA SYRIAN.—No one was returned under "Reformed Syrian" in this census though 74,866 were returned under this denomination in 1911. As Reformed Syrians are Mar Thoma Syrians and as the Head of the Mar Thoma Church had instructed the adherents of his Church to return themselves in this census as "Mar Thoma Syrian" they have returned accordingly.

4. JACOBITE SYRIAN.—This number includes 23,347 (12,337 males and 11,010 females) returned under the general term "Syrian" and 349 (189 males and 160 females) "Kananaya Syrian" or Sndhist.

MINOR PROTESTANT DENOMINATIONS.

UNDER THESE ARE INCLUDED.

SECT NOT RETURNED.

UNDER THIS ARE INCLUDED.

		Males.	Females.
1. Sabbath Mission	...	13	12
2. Deva Sabha	...	20	32
3. Prathyksha Reksha Sabha	...	251	273
4. American Mission	...	28	196
5. Pentecost	...	54	54
6. Brother Mission	...	1,666	1,360
7. Advent Mission	...	3	2
Total	...	2,035	1,929

PROTESTANT (UNSECTARIAN OR SECT NOT SPECIFIED.)

UNDER THIS ARE INCLUDED.

		Males.	Females.
1. Swadheena Mission	...	10	8
2. Unsectarian	...	4	...
3. Unspecified	...	445	288
Total	...	459	296

		Males.	Females.
1. Native Christian	...	109	16
2. Christian	...	1,159	907
3. Paraya Christian	...	2	14
4. Puliya Christian	...	139	177
5. Indian Christian	...	317	284
6. Convert C.I.	...	472	634
7. Putha Christian	...	76	...
8. Malayan	...	9	11
9. Sambavar	7
10. Aiyanavar	...	71	53

Total ... 2,354 2,103

5 YUYOMAYAM.—1,121 persons were returned under "Yuyomayam" and shown under "Indefinite beliefs" in 1911; and this time according to the instructions contained in Imperial Census Commissioner's Letter No. 74-96/ dated 31.1.21 it should be returned under "others". That the Yuyomayam is an Indefinite belief is not correct. The belief namely "Christianity" is definite enough but the sect is indefinite. As there is no sect or sub-sect in the list given under which it may be included it is shown as a separate sect among Christians.

6. AIYANAVAR AND SAMBAVAR CHRISTIANS.—124 persons were returned in this Census for the first time under the former and 7 persons under the latter. They claim to be classed under separate denomination and request to be treated as such. But as there are Aiyanavar and Sambavar Hindus also in these Singhauns, similar to Pulaya or Paraya Christians, they are included under "sect not returned" like the latter.

TABLE XIX.

SHOWING THE NUMBER OF PERSONS WHO RETURNED CERTAIN
NON-AGRICULTURAL OCCUPATIONS AS THEIR PRINCIPAL
MEANS OF LIVELIHOOD WITH AGRICULTURAL
OCCUPATIONS AS THEIR SUBSIDIARY
MEANS OF LIVELIHOOD.

NOTE :—This Table is optional. Changes in the headings of this table were made subsequent to the issue of Part II of the Census Code containing instructions for tabulation. In the preparation of this table, the headings of both the old and modified forms are provided, except in the place of "Others" (Columns 10 and 11 of the modification) the name of one of the dual occupation which is subsidiary to the other, is given.

2. Agricultural occupations include groups 1 to 5 of Table XVII.

TABLE XX.

**DISTRIBUTION BY RELIGION OF WORKERS AND DEPENDANTS
IN DIFFERENT OCCUPATIONS.**

NOTE :—As no figures have been returned under orders Nos. 19, 42, 43 and 56. they are omitted.

TABLE XX.

TABLE XX.

Distribution by religion
of workers and depen-
dants in different occu-
pations.

Distribution by religion of
workers and dependants in
different occupations.

TABLE XXII.
INDUSTRIAL STATISTICS.

Part I. State Summary.
Part II. Distribution by Divisions.
Part III. Industrial Establishments classified according to the class of Owners and Managers.
Part IV. Caste or Race and Birth-place of skilled workmen classified according to their industry and occupation.
Part V. Caste or Race and Birth-place of unskilled labourers classified according to the industry in which they are working.
Part VI. Details of Power employed for Establishments using Steam, Oil, Gas, Water and Electricity.
Part VII. Number of Looms in use in Textile Establishments.

NOTE. — Statement showing the details of Women employed as Managers, or among the Supervising and Clerical Staff (Columns 6-11 of Parts I and II of the Table.)

Description of establishments in which women are employed as Managers or among the Supervising or Clerical Staff.	Division.	Classification of establishments according to the number of persons employed (including management.)	Number of establishments.	Classification of persons (Females) employed.							
				Total of persons employed as supervising and clerical staff.		Direction, supervision and clerical staff.

(3) For Establishments using Electric Power Supplied from outside.

DESCRIPTION OF ESTABLISHMENT.	NUMBER OF ESTABLISHMENTS.	NUMBER OF MOTORS INSTALLED.	TOTAL HORSE POWER.
1	2	3	4
I. GROWING OF SPECIAL PRODUCTS ...	3
Tea Factories ...	3	4	200
		4	200

* One of this has also one Water Engine with 40 horse power for use when electricity runs short.

TABLE XXII.

Industrial Statistics.
Part VII. Number of looms
in use in Textile
Establishments

TABLE XXII.

INDUSTRIAL STATISTICS
PART VII.
Number of Looms in use in Textile Establishments.

DIVISION.	COTTON WEAVING ESTABLISHMENTS			
	Number of Establishments.	NUMBER OF LOOMS AT WORK.		
		Worked by power.	Worked by hand.	
			With fly Shuttle.	Without fly Shuttle.
1	2	3	4	5
STATE.	33	...	216	138
Southern Division	21	...	125	65
Central Do.	6	...	38	11
Northern Do.	6	...	53	62

NOTE:—There are also 348 looms (without Fly Shuttle) worked by hand in a Coir Matting Factory in the Central Division.

PROVINCIAL TABLE I.

AREA AND POPULATION OF TALUKS AND MUNICIPAL TOWNS.

NOTE:—The number of Taluks was reduced from 33 in the last Census to 30 in this and the particulars of the changes in the component parts of the affected Taluks are:

No. Present Taluk.	Particulars of the component Parts of the Taluk.
1. Tovala	...The old Tovala Taluk and the Erachakulam Pakuthy of the old Agastiswaram Taluk.
2. Agastiswaram	...The old Agastiswaram Taluk except Erachakulam Pakuthy and the Pakuthy of Neendakara A and B of the old Eraniel Taluk.
3. Kalkulam	...The old Kalkulam Taluk and the Pakuthies of Aloor, Eraniel, Thalakulam, Kadiyapattanam, Manavalakurichi, Colachel and Thiruvithamcode of the old Eraniel Taluk.
4. Vilavankod	...The old Vilavankod Taluk and the Pakuthies of Kizhmidalam, Midalam, Kizhkulam, Killiyur and Nattalam of the old Eraniel Taluk.
5. Kunnattur	...The old Kunnattur Taluk excepting the Pakuthy of Vallikode.
6. Pathanamthitta	...The Pakuthies of Ranni, Ilanthur, Pathanamthitta, Kumpazha and Omallur of the old Chenganur Taluk, Cherukol Pakuthy of the old Tiruvalla Taluk and Vallikode Pakuthy of the old Kunnattur Taluk.
7. Tiruvalla	...The old Tiruvalla Taluk and the Pakuthies of Thiruvannamdoor, Puthenkavu, Vadakkekara, Pandanadu, Chengannur, Puliur, Venmani, Pandalam Vadakkekara, Cherianadu and Ala of the old Chengannur Taluk.
8. Ambalapuzha	...The old Ambalapuzha Taluk and the Pakuthies of Ariad North, Ariad South and Mararikulam South of the old Sherttallay Taluk.
9. Sherttallay	...The old Sherttallay Taluk with the exception of the Pakuthies of Ariad North, Ariad South and Mararikulam South and the Pakuthies of Thaikkattusserri, Pallipuram, Panavalli, and Vaduthala Mattathilbhagam of the old Vaikam Taluk.
10. Vaikam	...The old Vaikam Taluk with the exception of the Pakuthies of Pallipuram, Panavalli, Vaduthala Mattathilbhagam and Thaikkattusserri and the Pakuthies of Manjoor and Kaduthuruthi of the old Ettumanur Taluk.
11. Kottayam	...The old Kottayam Taluk and the Pakuthies of Kodumalur, Perumpoikadu, Kaipuzha, Ettumanur and Onamthuruthu of the old Ettumanur Taluk.
12. Minachil	...The old Minachil Taluk and the Pakuthies of Ilakad, Kidangur and Kanakary of the old Ettumanur Taluk, the Pakuthy of Poonjar of the old Peermade Taluk and the Pakuthy of Uzhavur of the old Muvattupuzha Taluk.
13. Changanachery	...The old Taluk of Changanachery and the Pakuthies of Manimala, Cheruvalli, Chirakadavu, Kanjirapalli North and Kanjirapalli South of the old Peermade Taluk.
14. Muvattupuzha	...The old Muvattupuzha Taluk with the exception of Uzhavur Pakuthy.
15. Kunnatnad	...The old Kunnatnad Taluk and the Pakuthies of Kothakulangara, Alwaye and Thrikkakara of the old Alengad Taluk.
16. Parur	...The old Parur Taluk and the Pakuthies of Aiyur, Alangad, Kadungallur, Chengamnad, Parakkadavu, Idapalli Vadakkumbhagam and Idapalli Thekkumbhagam of the old Alangad Taluk.
17. Peermade	...The old Taluk of Peermade with the exception of the Pakuthies of Poonjar, Manimala, Cheruvalli, Chirakadavu, Kanjirapalli North and Kanjirapalli South.

2. The population of Taluks includes that of Municipal Towns situated in them and the whole of Kayankulam Municipal Towns is included in Karunagapalli Taluk.
